|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

***ip-address mask*** (OPTIONAL) Enter the next-hop address in dotted decimal format and enter a mask in either dotted decimal or /prefix format.

***prefix-list*** (OPTIONAL) Enter the name of a prefix list name.

**Defaults** weight = **115**

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 6.3.1.0  | Introduced.                 |

**Usage Information**

The administrative distance indicates the trust value of incoming packets. A low administrative distance indicates a high trust rate. A high value indicates a lower trust rate. For example, a weight of 255 is interpreted that the routing information source is not trustworthy and should be ignored.

## distribute-list in

Filter network prefixes received in updates.

### S4820T

**Syntax**

`distribute-list prefix-list-name in [interface]`  
 To return to the default values, use the `no distribute-list prefix-list-name in [interface]` command.

**Parameters**

***prefix-list-name*** Specify the prefix list to filter prefixes in routing updates.

**interface** (OPTIONAL) Identifies the interface type slot/port as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 7.5.1.0  | Added IPv6 ISIS support.    |
| 6.3.1.0  | Introduced.                 |

**Related Commands**

- [distribute-list out](#) — suppresses networks from being advertised in updates.
- [redistribute](#) — redistributes routes from one routing domain to another routing domain.

## distribute-list out

Suppress network prefixes from being advertised in outbound updates.

**Syntax** `distribute-list prefix-list-name out [connected | bgp as number | ospf process-id | rip | static]`

To return to the default values, use the `no distribute-list prefix-list-name out [bgp as number connected | ospf process-id | rip | static]` command.

## Parameters

|                                |                                                                                                               |
|--------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b><i>prefix-list-name</i></b> | Specify the prefix list to filter prefixes in routing updates.                                                |
| <b>connected</b>               | (OPTIONAL) Enter the keyword <code>connected</code> for directly connected routing process.                   |
| <b><i>ospf process-id</i></b>  | (OPTIONAL) Enter the keyword <code>ospf</code> then the OSPF process-ID number. The range is from 1 to 65535. |
| <b><i>bgp as number</i></b>    | (OPTIONAL) Enter the BGP then the AS Number. The range is from 1 to 65535.                                    |
| <b>rip</b>                     | (OPTIONAL) Enter the keyword <code>rip</code> for RIP routes.                                                 |
| <b>static</b>                  | (OPTIONAL) Enter the keyword <code>static</code> for user-configured routing process.                         |

## Defaults

Not configured.

## Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 7.5.1.0  | Added IPv6 ISIS support.    |
| 6.3.1.0  | Introduced.                 |

## Usage Information

You can assign a name to a routing process so a prefix list IS applied to only the routes derived from the specified routing process.

## Related Commands

- [distribute-list in](#) — filters the networks received in updates.
- [redistribute](#) — redistributes routes from one routing domain to another routing domain.

## distribute-list redistributed-override

Suppress flapping of routes when the same route is redistributed into IS-IS from multiple routers in the network.

**Syntax** `distribute-list redistributed-override in`  
To return to the default, use the `no distribute-list redistributed-override in` command.

**Defaults** none

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.8.1.0  | Added IPv6 ISIS support.    |
| 6.3.1.0  | Introduced.                 |

**Usage Information** When you execute this command, IS-IS does not download the route to the routing table if the same route was redistributed into IS-IS routing protocol on the same router.

## domain-password

Set the authentication password for a routing domain.

**Syntax** `domain-password [hmac-md5 | encryption-type] password`  
To disable the password, use the `no domain-password` command.

|                   |                        |                                                                                                                                                                                                                          |
|-------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>hmac-md5</b>        | (OPTIONAL) Enter the keywords <code>hmac-md5</code> to encrypt the password using MD5.                                                                                                                                   |
|                   | <b>encryption-type</b> | (OPTIONAL) Enter 7 to encrypt the password using DES.                                                                                                                                                                    |
|                   | <b>password</b>        | Enter an alphanumeric string up to 16 characters long. If you do not specify an <code>encryption type</code> or <code>hmac-md5</code> keywords, the password is processed as plain text which provides limited security. |

**Defaults** No default password.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 6.3.1.0  | Introduced.                 |

**Usage Information** The domain password is inserted in Level 2 link state PDUs (LSPs), complete sequence number PDUs (CSNPs), and partial sequence number PDUs (PSNPs).

**Related Commands**

- [area-password](#) — configures an IS-IS area authentication password.
- [isis priority](#) — configures the authentication password for an interface.

## graceful-restart ietf

Enable graceful restart on an IS-IS router.

**Syntax** `graceful-restart ietf`  
 To return to the default, use the `no graceful-restart ietf` command.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <code>ietf</code> Enter <code>ietf</code> to enable graceful restart on the IS-IS router.                                                                      |
| <b>Defaults</b>        | Graceful restart disabled.                                                                                                                                     |
| <b>Command Modes</b>   | ROUTER ISIS                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 6.3.1.0  | Introduced on the E-Series. |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>Every graceful restart enabled router's HELLO PDUs includes a restart TLV. This restart enables (re)starting as well as the existing ISIS peers to detect the GR capability of the routers on the connected network. A flag in the Restart TLV contains restart request (RR), restart acknowledge (RA) and suppress adjacency advertisement (SA) bit flags.</p> <p>The ISIS graceful restart-enabled router can co-exist in mixed topologies where some routers are graceful restart-enabled and others are not. For neighbors that are not graceful restart-enabled, the restarting router brings up the adjacency per the usual methods.</p> |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## graceful-restart interval

Set the graceful restart grace period, the time during that all graceful restart attempts are prevented.

|               |                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>graceful-restart interval minutes</code><br>To return to the default, use the <code>no graceful-restart interval</code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                        |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <code>minutes</code> Enter the graceful-restart interval minutes. The range is from 1 to 20 minutes. The default is <b>5 minutes</b> . |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------|

|                 |                                                                                                                                                                |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Defaults        | <b>5 minutes</b>                                                                                                                                               |
| Command Modes   | ROUTER ISIS                                                                                                                                                    |
| Command History | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced on the E-Series. |

## graceful-restart restart-wait

Enable the graceful restart maximum wait time before a restarting peer comes up.

### Syntax

**NOTE:** Set the t3 timer to adjacency on the restarting router when implementing this command.

```
graceful-restart restart-wait seconds
```

To return to the default, use the `no graceful-restart restart-wait` command.

### Parameters

**seconds** Enter the graceful restart time in seconds. The range is from 5 to 300 seconds. The default is **30 seconds**.

Defaults **30 seconds**

Command Modes ROUTER ISIS

Command History This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced on the E-Series. |

**Related Commands** [graceful-restart t3](#) — configures the overall wait time before graceful restart completes.

## graceful-restart t1

Set the graceful restart wait time before unacknowledged restart requests are generated. This wait time is the interval before the system sends a restart request (an IIH with RR bit set in Restart TLV) until the CSNP is received from the helping router.

**Syntax** `graceful-restart t1 {interval seconds | retry-times value}`  
To return to the default, use the `no graceful-restart t1` command.

**Parameters**

|                    |                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interval</b>    | Enter the keyword <code>interval</code> to set the wait time. The range is from 5 to 120 seconds. The default is <b>5 seconds</b> .                                                                                     |
| <b>retry-times</b> | Enter the keywords <code>retry-times</code> to set the number of times the request interval is extended until a CSNP is received from the helping router. The range is from 1 to 10 attempts. The default is <b>1</b> . |

**Defaults** Refer to Parameters.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced on the E-Series. |

## graceful-restart t2

Configure the wait time for the graceful restart timer T2 that a restarting router uses as the wait time for each database to synchronize.

**Syntax** `graceful-restart t2 {level-1 | level-2} seconds`  
 To return to the default, use the `no graceful-restart t2` command.

**Parameters**

|                         |                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level-1, level-2</b> | Enter the keywords <code>level-1</code> or <code>level-2</code> to identify the database instance type to which the wait interval applies. |
| <b>seconds</b>          | Enter the <code>graceful-restart t2</code> time in seconds. The range is from 5 to 120 seconds. The default is <b>30 seconds</b> .         |

**Defaults** **30 seconds**

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced on the E-Series. |

## graceful-restart t3

Configure the overall wait time before graceful restart completes.

**Syntax** `graceful-restart t3 {adjacency | manual} seconds`  
To return to the default, use the `no graceful-restart t3` command.

**Parameters**

|                  |                                                                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>adjacency</b> | Enter the keyword <code>adjacency</code> so that the restarting router receives the remaining time value from its peer and adjusts its T3 value so if you have configured this option. |
| <b>manual</b>    | Enter the keyword <code>manual</code> to specify a time value that the restarting router uses. The range is from 50 to 120 seconds. The default is <b>30 seconds</b> .                 |

**Defaults** manual, **30 seconds**

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced on the E-Series. |

**Usage Information** The running router sets the remaining time value to the current adjacency hold time. You can override this setting by implementing this command.

Override the default restart-wait time by entering the `no graceful-restart restart-wait` command. When you disable `restart-wait`, the current adjacency hold time is used.

Set the `t3` timer to `adjacency` on the restarting router when implementing this command. The restarting router gets the remaining time value from its peer and adjusts its T3 value so only when you have configured `graceful-restart t3 adjacency`.

**Related Commands**      [graceful-restart restart-wait](#) — enables the graceful restart maximum wait time before a restarting peer comes up.

## hello padding

Use to turn ON or OFF padding for LAN and point-to-point hello PDUs or to selectively turn padding ON or OFF for LAN or point-to-point hello PDUs.

**Syntax**                    `hello padding [multi-point | point-to-point]`  
To return to the default, use the `no hello padding [multi-point | point-to-point]` command.

**Parameters**

|                       |                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------|
| <b>multi-point</b>    | (OPTIONAL) Enter the keywords <code>multi-point</code> to pad only LAN hello PDUs.         |
| <b>point-to-point</b> | (OPTIONAL) Enter the keywords <code>point-to-point</code> to pad only point-to-point PDUs. |

**Defaults**                    Both LAN and point-to-point hello PDUs are padded.

**Command Modes**            ROUTER ISIS

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information**           IS-IS hellos are padded to the full maximum transmission unit (MTU) size. Padding IS-IS Hellos (IIHS) to the full MTU provides early error detection of large frame transmission problems or mismatched MTUs on adjacent interfaces.

**Related Commands**        [isis hello padding](#) — turns ON or OFF hello padding on an interface basis.

## hostname dynamic

Enables dynamic learning of hostnames from routers in the domain and allows the routers to advertise the hostname in LSPs.

| <b>Syntax</b>            | <code>hostname dynamic</code><br>To disable this command, use the <code>no hostname dynamic</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|-----------------------------|---------|--------------------------|----------|---------------------------|----------|--------------------------|----------|--------------------------|
| <b>Defaults</b>          | Enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

| 8.3.19.0                 | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| 8.3.12.0                 | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| 8.3.11.1                 | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| <b>Usage Information</b> | To build name-to-systemID mapping tables through the protocol, use this command. All <code>show</code> commands that display systems also display the hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| <b>Related Commands</b>  | <a href="#">clns host</a> — defines a name-to-NSAP mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

## ignore-lsp-errors

Ignore LSPs with bad checksums instead of purging those LSPs.

|                      |                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>ignore-lsp-errors</code><br>To return to the default values, use the <code>no ignore-lsp-errors</code> command. |
| <b>Defaults</b>      | In IS-IS, the default deletes LSPs with internal checksum errors ( <code>no ignore-lsp-errors</code> ).               |
| <b>Command Modes</b> | ROUTER ISIS                                                                                                           |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information**

IS-IS normally purges LSPs with an incorrect data link checksum causing the LSP source to regenerate the message. A cycle of purging and regenerating LSPs can occur when a network link continues to deliver accurate LSPs even though there is a link causing data corruption. This process could cause disruption to your system operation.

## ip router isis

Configure IS-IS routing processes on an interface and attach an area tag name to the routing process.

**Syntax**

```
ip router isis [tag]
```

To disable IS-IS on an interface, use the `no ip router isis [tag]` command.

**Parameters**

**tag** (OPTIONAL) The tag you specify identifies a specific area routing process. If you do not specify a tag, a null tag is assigned.

**Defaults**

No processes are configured.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.5.1.0  | Introduced.                 |

#### Usage Information

To assign a network entity title to enable IS-IS, use the `net` command. This command accepts even if an IP address is not configured. This command is cached in the L3 Manager till the IP address is configured. When the IP address configuration reaches the L3Manager, the circuit add message is sent to IS-IS.

**NOTE:** IP address is not mandatory for forming IS-IS adjacency.

#### Related Commands

- [net](#) — configures an IS-IS network entity title (NET) for the routing process.
- [router isis](#) — enables the IS-IS routing protocol.

## ipv6 router isis

Enable the IPv6 IS-IS routing protocol and specify an IPv6 IS-IS process.

#### Syntax

```
ipv6 router isis [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

#### Parameters

**tag** (OPTIONAL) This parameter is a unique name for a routing process. A null tag is assumed if the tag option is not specified. The tag name must be unique for all IP router processes for a given router.

#### Defaults

Not configured.

#### Command Modes

ROUTER ISIS

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.5.1.0  | Introduced on the E-Series. |

#### Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

To establish adjacencies and establish dynamic routing, enable routing on one or more interfaces.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

#### Related Commands

- [net](#) — configures an IS-IS network entity title (NET) for the routing process.
- [is-type](#) — assigns a type for a given area.

## isis circuit-type

Configure the adjacency type on interfaces.

#### Syntax

```
isis circuit-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no isis circuit-type` command.

#### Parameters

|                     |                                                                                                                                                                                                                  |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level-1</b>      | You can form a Level 1 adjacency if there is at least one common area address between this system and neighbors. You cannot form Level 2 adjacencies on this interface.                                          |
| <b>level-1-2</b>    | You can form a Level 1 and Level 2 adjacencies when the neighbor is also configured as Level-1-2 and there is at least one common area, if not, a Level 2 adjacency is established. This setting is the default. |
| <b>level-2-only</b> | You can form a Level 2 adjacencies when other Level 2 or Level 1-2 routers and their interfaces are configured for Level 1-2 or Level 2. Level 1 adjacencies cannot be established on this interface.            |

| <b>Defaults</b>          | <b>level-1-2</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

| 8.3.11.1                 | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| <b>Usage Information</b> | <p>Because the default establishes Level 1 and Level 2 adjacencies, you do not need to configure this command. Routers in an IS-IS system must be configured as a Level 1-only, Level 1-2, or Level 2-only system.</p> <p>Only configure interfaces as Level 1 or Level 2 on routers that are between areas (for example, a Level 1-2 router) to prevent the software from sending unused hello packets and wasting bandwidth.</p>                                                                                                                                                                                                                                                                                                                               |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

## isis csnp-interval

Configure the IS-IS complete sequence number PDU (CSNP) interval on an interface.

**Syntax**            `isis csnp-interval seconds [level-1 | level-2]`  
 To return to the default values, use the `no isis csnp-interval [seconds] [level-1 | level-2]` command.

**Parameters**

|                |                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b> | Interval of transmission time between CSNPs on multi-access networks for the designated intermediate system. The range is from 0 to 65535. The default is <b>10</b> . |
| <b>level-1</b> | (OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 1.                                                                   |
| <b>level-2</b> | (OPTIONAL) Independently configures the interval of time between transmission of CSNPs for Level 2.                                                                   |

| <b>Defaults</b>          | seconds = <b>10</b> ; <b>level-1</b> (if not otherwise specified)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

| 8.3.11.1                 | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| <b>Usage Information</b> | <p>The default values of this command are typically satisfactory transmission times for a specific interface on a designated intermediate system. To maintain database synchronization, the designated routers send CSNPs.</p> <p>You can configure Level 1 and Level 2 CSNP intervals independently.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

## isis hello-interval

Specify the length of time between hello packets sent.

|                   |                                                                                                                                                                                       |                                                                                                                                   |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>isis hello-interval seconds [level-1   level-2]</pre> <p>To return to the default values, use the <code>no isis hello-interval [seconds] [level-1   level-2]</code> command.</p> |                                                                                                                                   |
| <b>Parameters</b> | <b>seconds</b>                                                                                                                                                                        | Allows you to set the length of time between hello packet transmissions. The range is from 1 to 65535. The default is <b>10</b> . |
|                   | <b>level-1</b>                                                                                                                                                                        | (OPTIONAL) Select this value to configure the hello interval for Level 1. This value is the default.                              |
|                   | <b>level-2</b>                                                                                                                                                                        | (OPTIONAL) Select this value to configure the hello interval for Level 2.                                                         |
| <b>Defaults</b>   | seconds = <b>10</b> ; <b>level-1</b> (if not otherwise specified)                                                                                                                     |                                                                                                                                   |

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information** Hello packets are held for a length of three times the value of the hello interval. To conserve bandwidth and CPU usage, use a high hello interval seconds. Use a low hello interval seconds for faster convergence (but uses more bandwidth and CPU resources).

**Related Commands** [isis hello-multiplier](#) — specifies the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency as down.

## isis hello-multiplier

Specify the number of IS-IS hello packets a neighbor must miss before the router declares the adjacency down.

**Syntax** `isis hello-multiplier multiplier [level-1 | level-2]`  
To return to the default values, use the `no isis hello-multiplier [multiplier] [level-1 | level-2]` command.

**Parameters**

|                   |                                                                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>multiplier</b> | Specifies an integer that sets the multiplier for the hello holding time. Never configure a hello-multiplier lower than the default (3). The range is from 3 to 1000. The default is <b>3</b> . |
| <b>level-1</b>    | (OPTIONAL) Select this value to configure the hello multiplier independently for Level 1 adjacencies. This value is the default.                                                                |
| <b>level-2</b>    | (OPTIONAL) Select this value to configure the hello multiplier independently for Level 2 adjacencies.                                                                                           |

| <b>Defaults</b>          | multiplier = <b>3</b> ; <b>level-1</b> (if not otherwise specified)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

| <b>Usage Information</b> | The holdtime (the product of the hello-multiplier multiplied by the hello-interval) determines how long a neighbor waits for a hello packet before declaring the neighbor is down so routes can be recalculated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |
| <b>Related Commands</b>  | <a href="#">isis hello-interval</a> — specifies the length of time between hello packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

## isis hello padding

Turn ON or OFF padding of hello PDUs from INTERFACE mode.

| <b>Syntax</b>          | <pre>isis hello padding</pre> <p>To return to the default, use the <code>no isis hello padding</code> command.</p>                                                                                                                                                                                                                                                                                                                               |         |             |          |                             |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|-----------------------------|
| <b>Defaults</b>        | Padding of hello PDUs is enabled (ON).                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.12.0 | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information**

Hello PDUs are “padded” only when both the global and interface padding options are ON. Turning either one OFF disables padding for the corresponding interface.

**Related Commands**

[hello padding](#) — turns ON or OFF padding for LAN and point-to-point hello PDUs.

## isis ipv6 metric

Assign metric to an interface for use with IPv6 information.

**Syntax**

```
isis ipv6 metric default-metric [level-1 | level-2]
```

To return to the default values, use the `no ipv6 isis metric [default-metric] [level-1 | level-2]` command.

**Parameters**

|                              |                                                                                                                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>default-metric</i></b> | Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215. The default is <b>10</b> . |
| <b>level-1</b>               | (OPTIONAL) Enter the keywords <code>level-1</code> to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This value is the default.                                                                                          |
| <b>level-2</b>               | (OPTIONAL) Enter the keywords <code>level-2</code> to configure the SPF calculation for Level 2 (inter-area) routing.                                                                                                                                           |

**Defaults**

`default-metric = 10; level-1` (if not otherwise specified)

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.5.1.0  | Introduced on the E-Series. |

#### Usage Information

Dell Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.

## isis metric

Assign a metric to an interface.

#### Syntax

```
isis metric default-metric [level-1 | level-2]
```

To return to the default values, use the `no isis metric [default-metric] [level-1 | level-2]` command.

#### Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>default-metric</i></b> | <p>Metric assigned to the link and used to calculate the cost from each other router via the links in the network to other destinations. You can configure this metric for Level 1 or Level 2 routing. The range is from 0 to 16777215 irrespective of the metric style. The default is <b>10</b>.</p> <p>If metric value is configured to more than 63, system throughs the following warning:Warning: for metrics greater than 63, 'metric-style wide' should be configured on level-1-2, or it will be capped at 63.</p> <p>If the metric style is WIDE, the metric values that are greater than 63 are only effective.</p> |
| <b>level-1</b>               | (OPTIONAL) Enter the keywords <code>level-1</code> to configure the shortest path first (SPF) calculation for Level 1 (intra-area) routing. This setting is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>level-2</b>               | (OPTIONAL) Enter the keywords <code>level-2</code> to configure the SPF calculation for Level 2 (inter-area) routing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Defaults</b>          | default-metric = <b>10</b> ; <b>level-1</b> (if not otherwise specified)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

| <b>Usage Information</b> | Dell Networking recommends configuring metrics on all interfaces. Without configuring this command, the IS-IS metrics are similar to hop-count metrics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |         |                          |          |                           |          |                          |          |                          |

## isis network point-to-point

Enable the software to treat a broadcast interface as a point-to-point interface.

| <b>Syntax</b>          | <pre>isis network point-to-point</pre> <p>To disable the feature, use the <code>no isis network point-to-point</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                             |         |                          |          |                           |          |                          |

| Version                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                             |         |                          |          |                           |          |                          |
| 9.7(0.0)               | Introduced on the S6000-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                             |         |                          |          |                           |          |                          |
| 9.0.2.0                | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |         |                          |          |                           |          |                          |
| 8.3.19.0               | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |         |                          |          |                           |          |                          |
| 8.3.12.0               | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |         |                          |          |                           |          |                          |

| Version  | Description              |
|----------|--------------------------|
| 8.3.11.1 | Introduced on the Z9000. |

## isis password

Configure an authentication password for an interface.

**Syntax** `isis password [hmac-md5] password [level-1 | level-2]`  
 To delete a password, use the `no isis password [password] [level-1 | level-2]` command.

| Parameters             |            |                                                                                                                                                         |
|------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>encryption-type</b> | (OPTIONAL) | Enter 7 to encrypt the password using DES.                                                                                                              |
| <b>hmac-md5</b>        | (OPTIONAL) | Enter the keywords <code>hmac-md5</code> to encrypt the password using MD5.                                                                             |
| <b>password</b>        |            | Assign the interface authentication password.                                                                                                           |
| <b>level-1</b>         | (OPTIONAL) | Independently configures the authentication password for Level 1. The router acts as a station router for Level 1 routing. This setting is the default. |
| <b>level-2</b>         | (OPTIONAL) | Independently configures the authentication password for Level 2. The router acts as an area router for Level 2 routing.                                |

**Defaults** No default password. **level-1** (if not otherwise specified).

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

## Usage Information

To protect your network from unauthorized access, use this command to prevent unauthorized routers from forming adjacencies.

You can assign different passwords for different routing levels by using the keywords `level-1` and `level-2`.

The `no` form of this command disables the password for Level 1 or Level 2 routing, using the respective keywords `level-1` or `level-2`.

This password provides limited security as it is processed as plain text.

## isis priority

Set the priority of the designated router you select.

### Syntax

```
isis priority value [level-1 | level-2]
```

To return to the default values, use the `no isis priority [value] [level-1 | level-2]` command.

### Parameters

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>value</b>   | This value sets the router priority. The higher the value, the higher the priority. The range is from 0 to 127. The default is <b>64</b> . |
| <b>level-1</b> | (OPTIONAL) Specify the priority for Level 1. This setting is the default.                                                                  |
| <b>level-2</b> | (OPTIONAL) Specify the priority for Level 2.                                                                                               |

### Defaults

value = **64**; **level-1** (if not otherwise specified).

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.12.0</b> | Introduced on the S4810.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |

## Usage Information

You can configure priorities independently for Level 1 and Level 2. Priorities determine which router on a LAN is the designated router. Priorities are advertised within hellos. The router with the highest priority becomes the designated intermediate system (DIS).

**NOTE:** Routers with a priority of 0 cannot be a designated router.

Setting the priority to 0 lowers the chance of this system becoming the DIS, but does not prevent it. If all the routers have priority 0, one with highest MAC address becomes DIS even though its priority is 0.

## is-type

Configure IS-IS operating level for a router.

### Syntax

```
is-type {level-1 | level-1-2 | level-2-only}
```

To return to the default values, use the `no is-type` command.

### Parameters

|                     |                                                                                           |
|---------------------|-------------------------------------------------------------------------------------------|
| <b>level-1</b>      | Allows a router to act as a Level 1 router.                                               |
| <b>level-1-2</b>    | Allows a router to act as both a Level 1 and Level 2 router. This setting is the default. |
| <b>level-2-only</b> | Allows a router to act as a Level 2 router.                                               |

### Defaults

**level-1-2**

### Command Modes

ROUTER ISIS

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.12.0</b> | Introduced on the S4810.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |

**Usage  
Information**

The IS-IS protocol automatically determines area boundaries and are able to keep Level 1 and Level 2 routing separate. Poorly planned use of this feature may cause configuration errors, such as accidental area partitioning.

If you are configuring only one area in your network, you do not need to run both Level 1 and Level 2 routing algorithms. You can configure the IS type as Level 1.

## log-adjacency-changes

Generate a log messages for adjacency state changes.

**Syntax**

`log-adjacency-changes`

To disable this function, use the `no log-adjacency-changes` command.

**Defaults**

Adjacency changes are not logged.

**Command  
Modes**

ROUTER ISIS

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage  
Information**

This command allows you to monitor adjacency state changes, which are useful when you monitor large networks. Messages are logged in the system's error message facility.

# lsp-gen-interval

Set the minimum interval between successive generations of link-state packets (LSPs).

**Syntax**

```
lsp-gen-interval [level-1 | level-2] interval seconds  
[initial_wait_interval seconds [second_wait_interval seconds]]
```

To restore default values, use the `no lsp-gen-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

**Parameters**

|                                      |                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level-1</b>                       | (OPTIONAL) Enter the keywords <code>level-1</code> to apply the configuration to generation of Level-1 LSPs.                                                       |
| <b>level-2</b>                       | (OPTIONAL) Enter the keywords <code>level-2</code> to apply the configuration to generation of Level-2 LSPs.                                                       |
| <b>interval seconds</b>              | Enter the maximum number of seconds between LSP generations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> .                                 |
| <b>initial_wait_interval seconds</b> | (OPTIONAL) Enter the initial wait time, in seconds, before running the first LSP generation. The range is from 0 to 120 seconds. The default is <b>1 second</b> .  |
| <b>second_wait_interval seconds</b>  | (OPTIONAL) Enter the wait interval, in seconds, between the first and second LSP generation. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |

**Defaults** Refer to *Parameters*.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                   |
| 9.0.2.0  | Introduced on the S6000.                      |
| 8.3.19.0 | Introduced on the S4820T.                     |
| 8.3.12.0 | Introduced on the S4810.                      |
| 8.3.11.1 | Introduced on the Z9000.                      |
| 7.5.1.0  | Added support for LSP Throttling Enhancement. |

## Usage Information

LSP throttling slows down the frequency at which LSPs are generated during network instability. Even though throttling LSP generations slows down network convergence, no throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of LSP generations until the topology regains its stability.

The first generation is controlled by the initial wait interval and the second generation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

## lsp-mtu

Set the maximum transmission unit (MTU) of IS-IS link-state packets (LSPs). This command only limits the size of LSPs this router generates.

### Syntax

```
lsp-mtu size
```

To return to the default values, use the `no lsp-mtu` command.

### Parameters

**size**

The maximum LSP size, in bytes. The range is from 512 to 16000 for Non-Jumbo mode and from 128 to 9195 for Jumbo mode. The default is **1497**.

**NOTE:** The appropriate interface circuit is brought down and removed.

### Defaults

**1497** bytes.

### Command Modes

ROUTER ISIS

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                     |
| 8.3.12.0 | Introduced on the S4810.                      |
| 8.3.11.1 | Introduced on the Z9000.                      |
| 7.5.1.0  | Added support for LSP Throttling Enhancement. |

#### Usage Information

The link MTU and the LSP MTU size must be the same.

Because each device can generate a maximum of 255 LSPs, consider carefully whether you use the `lsp-mtu` command.

## lsp-refresh-interval

Set the link state PDU (LSP) refresh interval. LSPs must be refreshed before they expire. When the LSPs are not refreshed after a refresh interval, they are kept in a database until their `max-lsp-lifetime` reaches zero and then LSPs is purged.

#### Syntax

`lsp-refresh-interval seconds`

To restore the default refresh interval, use the `no lsp-refresh-interval` command.

#### Parameters

**seconds**

The LSP refresh interval, in seconds. This value must be 300 seconds less than the value specified in the `max-lsp-lifetime` command. The range is from 1 to 65535 seconds. The default is **900**.

#### Defaults

**900** seconds

#### Command Modes

ROUTER ISIS

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                     |
| 8.3.12.0 | Introduced on the S4810.                      |
| 8.3.11.1 | Introduced on the Z9000.                      |
| 7.5.1.0  | Added support for LSP Throttling Enhancement. |

#### Usage Information

The refresh interval determines the rate at which route topology information is transmitted preventing the information from becoming obsolete.

The refresh interval must be less than the LSP lifetime specified with the `max-lsp-lifetime` command. A low value reduces the amount of time that undetected link state database corruption can persist at the cost of increased link utilization. A higher value reduces the link utilization the flooding of refreshed packets causes.

#### Related Commands

[max-lsp-lifetime](#) — sets the maximum interval that LSPs persist without being refreshed.

## max-area-addresses

Configure manual area addresses.

#### Syntax

`max-area-addresses number`

To return to the default values, use the `no max-area-addresses` command.

#### Parameters

***number***

Set the maximum number of manual area addresses. The range is from 3 to 6. The default is **3**.

#### Defaults

**3** addresses

#### Command Modes

ROUTER ISIS

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                                   |
|----------|-----------------------------------------------|
| 8.3.12.0 | Introduced on the S4810.                      |
| 8.3.11.1 | Introduced on the Z9000.                      |
| 7.5.1.0  | Added support for LSP Throttling Enhancement. |

**Usage Information**

To configure the number of area addresses on router, use this command. This value must be consistent with routers in the same area, otherwise the router forms only Level 2 adjacencies. The value must be same among all the routers to form Level 1 adjacencies.

## max-lsp-lifetime

Set the maximum time that link-state packets (LSPs) exist without being refreshed.

**Syntax**

`max-lsp-lifetime seconds`

To restore the default time, use the `no max-lsp-lifetime` command.

**Parameters**

**seconds** The maximum lifetime of LSP in seconds. This value must be greater than the `lsp-refresh-interval` command. The higher the value the longer the LSPs are kept. The range is from 1 to 65535. The default is **1200**.

**Defaults**

**1200** seconds

**Command Modes**

ROUTER ISIS

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information**

Change the maximum LSP lifetime with this command. The maximum LSP lifetime must always be greater than the LSP refresh interval.

The `seconds` parameter enables the router to keep LSPs for the specified length of time. If the value is higher, the overhead is reduced on slower-speed links.

**Related  
Commands**

[lsp-refresh-interval](#) — sets the link-state packet (LSP) refresh interval.

## maximum-paths

Allows you to configure the maximum number of equal cost paths allowed in a routing table.

 **NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 addresses.

**Syntax**

`maximum-paths number`

To return to the default values, use the `no maximum-paths` command.

**Parameters**

*number*

Enter a number as the maximum number of parallel paths an IP routing installs in a routing table. The range is from 1 to 64. The default is **4**.

**Defaults**

**4**

**Command  
Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                            |
|----------|----------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.            |
| 9.0.2.0  | Introduced on the S6000.               |
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.12.0 | Introduced on the S4810.               |
| 8.3.11.1 | Introduced on the Z9000.               |
| 7.8.1.0  | Added support for multi-topology ISIS. |
| 6.3.1.0  | Introduced.                            |

# metric-style

To generate and accept old-style, new-style, or both styles of type, length, and values (TLV), configure a router.

## Syntax

```
metric-style {narrow [transition] | transition | wide  
[transition]} [level-1 | level-2]
```

To return to the default values, use the `no metric-style {narrow [transition] | transition | wide [transition]} [level-1 | level-2]` command.

## Parameters

|                   |                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------|
| <b>narrow</b>     | Allows you to generate and accept old-style TLVs. The metric range is from 0 to 63.            |
| <b>transition</b> | Allows you to generate both old-style and new-style TLVs. The metric range is from 0 to 63.    |
| <b>wide</b>       | Allows you to generate and accept only new-style TLVs. The metric range is from 0 to 16777215. |
| <b>level-1</b>    | Enables the metric style on Level 1.                                                           |
| <b>level-2</b>    | Enables the metric style on Level 2.                                                           |

## Defaults

**narrow**; if no Level is specified, Level-1 and Level-2 are configured.

## Command Modes

ROUTER ISIS

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.12.0</b> | Introduced on the S4810.    |

## Usage Information

If you enter the `metric-style wide` command, the Dell Networking OS generates and accepts only new-style TLVs. The router uses less memory and other resources rather than generating both old-style and new-style TLVs.

The new-style TLVs have wider metric fields than old-style TLVs.

When wide transition is configured, narrow metric is sent for the narrow metric TLV and the actual wide metric is sent in wide metric TLV. The receiver can choose to use the metric that is requires.

**Related Commands**      [isis metric](#) — configures a metric for an interface.

## multi-topology

Enables multi-topology IS-IS. It also allows enabling/disabling of old and new style TLVs for IP prefix information in the LSPs.

**Syntax**                      `multi-topology [transition]`  
To return to a single topology configuration, use the `no multi-topology [transition]` command.

**Parameters**                      **transition**

**Defaults**                          Disabled

**Command Modes**                      CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |
| 7.8.1.0  | Introduced.                 |

## net

To configure an IS-IS network entity title (NET) for a routing process, use this mandatory command. If you did not configure a NET, the IS-IS process does not start.

**Syntax** `net network-entity-title`

To remove a net, use the `no net network-entity-title` command.

### Parameters

***network-entity-title***

Specify the area address and system ID for an IS-IS routing process. The first 1 to 13 bytes identify the area address. The next 6 bytes identify the system ID. The last 1 byte is the selector byte, always identified as zero zero (00). This argument can be applied to an address or a name.

### Defaults

Not configured.

### Command Modes

ROUTER ISIS

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

## passive-interface

Suppress routing updates on an interface. This command stops the router from sending updates on that interface.

**Syntax** `passive-interface interface`

To delete a passive interface configuration, use the `no passive-interface interface` command.

### Parameters

***interface***

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** ROUTER ISIS

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |

**Usage Information** Although the passive interface does not send nor receive routing updates, the network on that interface is still included in the IS-IS updates sent using other interfaces.

## redistribute

Redistribute routes from one routing domain to another routing domain.

**Syntax** `redistribute {static | connected | rip} [level-1 | level-1-2 | level-2] [metric metric-value] [metric-type {external | internal}] [route-map map-name]`

To end redistribution or disable any of the specified keywords, use the `no redistribute {static | connected | rip} [metric metric-value] [metric-type {external | internal}] [level-1 | level-1-2 | level-2] [route-map map-name] command`.

## Parameters

|                                          |                                                                                                                                                                                                                                             |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                         | Enter the keyword <code>connected</code> to redistribute active routes into IS-IS.                                                                                                                                                          |
| <b>rip</b>                               | Enter the keyword <code>rip</code> to redistribute RIP routes into IS-IS.                                                                                                                                                                   |
| <b>static</b>                            | Enter the keyword <code>static</code> to redistribute user-configured routes into IS-IS.                                                                                                                                                    |
| <b>metric <i>metric-value</i></b>        | (OPTIONAL) Assign a value to the redistributed route. The range is from 0 to 16777215. The default is <b>0</b> . Use a value that is consistent with the destination protocol.                                                              |
| <b>metric-type {external   internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. Specify one of the following: <ul style="list-style-type: none"><li>• <code>external</code></li><li>• <code>internal</code></li></ul> |
| <b>level-1</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.                                                                                                                                                             |
| <b>level-1-2</b>                         | (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.                                                                                                                                                           |
| <b>level-2</b>                           | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.                                                                                                                                |
| <b>route-map <i>map-name</i></b>         | (OPTIONAL) If you do not enter the route-map argument, all routes are redistributed. If a map-name value is not specified, no routes are imported.                                                                                          |

## Defaults

- metric metric-value = **0**
- metric-type= internal; **level-2**

## Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |

| Version  | Description                  |
|----------|------------------------------|
| 8.3.12.0 | Introduced on the S4810.     |
| 7.5.1.0  | Added support for IPv6 ISIS. |
| 6.3.1.0  | Introduced.                  |

### Usage Information

To redistribute a default route (0.0.0.0/0), configure the `default-information originate` command.

Changing or disabling a keyword in this command does not affect the state of the other command keywords.

When an LSP with an internal metric is received, the Dell Networking OS considers the route cost while considering the advertised cost to reach the destination.

Redistributed routing information is filtered with the `distribute-list out` command to ensure that the routes are properly passed to the receiving routing protocol.

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow or Transition mode and the metric value in the `redistribute` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for Wide mode, the metric value in the `redistribute` command is advertised.

### Related Commands

- [default-information originate](#) — generates a default route for the IS-IS domain.
- [distribute-list out](#) — suppresses networks from being advertised in updates. This command filters redistributed routing information.

## redistribute bgp

Redistribute routing information from a BGP process.

**Syntax**

```
redistribute bgp AS number [level-1 | level-1-2 | level-2]
[metric metric-value] [metric-type {external | internal}]
[route-map map-name]
```

To return to the default values, use the `no redistribute bgp` command with the appropriate parameters.

### Parameters

**AS number** Enter a number that corresponds to the autonomous system number. The range is from 1 to 65355.

|                                                 |                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>level-1</b>                                  | (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 routes only.                                                                                                                                                                                                                                   |
| <b>level-1-2</b>                                | (OPTIONAL) Routes are independently redistributed into IS-IS Level 1 and Level 2 routes.                                                                                                                                                                                                                            |
| <b>level-2</b>                                  | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes only. This setting is the default.                                                                                                                                                                                                   |
| <b>metric <i>metric-value</i></b>               | (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .                                                                                                                              |
| <b>metric-type<br/>{external <br/>internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"> <li>• external</li> <li>• internal</li> </ul>                                                                                                         |
| <b>route-map<br/><i>map-name</i></b>            | map-name is an identifier for a configured route map. The route map filters imported routes from the source routing protocol to the current routing protocol.<br>If you do not specify a map-name, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported. |

#### Defaults

**IS-IS Level 2** routes only

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                  |
|----------|------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.  |
| 9.0.2.0  | Introduced on the S6000.     |
| 8.3.19.0 | Introduced on the S4820T.    |
| 8.3.11.1 | Introduced on the Z9000.     |
| 8.3.12.0 | Introduced on the S4810.     |
| 7.5.1.0  | Added support for IPv6 ISIS. |
| 6.3.1.0  | Introduced.                  |

**Usage Information** BGP to IS-IS redistribution supports “match” options using route maps. You can set the metric value, level, and metric-type of redistributed routes by the redistribution command. You can “set” more advanced options using route maps.

**Example**

```
FTOS(conf)#router is
FTOS(conf-router_isis)#redistribute bgp 1 level-1 metric 32
metric-type
external route-map rmap-isis-to-bgp
FTOS(conf-router_bgp)#show running-config isis
!
router isis
redistribute bgp 1 level-1 metric 32 metric-type external
route-map
rmap-isis-to-bgp
```

## redistribute ospf

Redistribute routing information from an OSPF process.

**Syntax**

```
redistribute ospf process-id [level-1 | level-1-2 | level-2]
[match {internal | external}] [metric metric-value] [metric-
type {external | internal}] [route-map map-name]
```

To return to the default values, use the `no redistribute ospf process-id [level-1 | level-1-2 | level-2] [match {internal | external}] [metric metric-value] [metric-type {external | internal}] [route-map map-name]` command.

### Parameters

|                                                 |                                                                                                                                                                                                          |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>                        | Enter a number that corresponds to the OSPF process ID to be redistributed. The range is from 1 to 65355.                                                                                                |
| <b><i>metric metric-value</i></b>               | (OPTIONAL) The value used for the redistributed route. Use a metric value that is consistent with the destination protocol. The range is from 0 to 16777215. The default is <b>0</b> .                   |
| <b><i>metric-type</i> {external   internal}</b> | (OPTIONAL) The external link type associated with the default route advertised into a routing domain. The two options are: <ul style="list-style-type: none"><li>• external</li><li>• internal</li></ul> |
| <b>level-1</b>                                  | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 1 routes.                                                                                                                          |
| <b>level-1-2</b>                                | (OPTIONAL) Routes are independently redistributed into IS-IS as Level-1-2 routes.                                                                                                                        |
| <b>level-2</b>                                  | (OPTIONAL) Routes are independently redistributed into IS-IS as Level 2 routes. This setting is the default.                                                                                             |

**match {external | internal}** (OPTIONAL) The command used for OSPF to route and redistribute into other routing domains. The values are

- `internal`
- `external`

**route-map  
map-name** `map-name` is an identifier for a configured route map. The route map should filter imported routes from the source routing protocol to the current routing protocol. If you do not specify a `map-name`, all routes are redistributed. If you specify a keyword, but fail to list route map tags, no routes are imported.

#### Defaults

Refer to Parameters.

#### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                  |
|----------|------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.  |
| 9.0.2.0  | Introduced on the S6000.     |
| 8.3.19.0 | Introduced on the S4820T.    |
| 8.3.11.1 | Introduced on the Z9000.     |
| 8.3.12.0 | Introduced on the S4810.     |
| 7.5.1.0  | Added support for IPv6 ISIS. |
| 6.3.1.0  | Introduced.                  |

#### Usage Information

How a metric value assigned to a redistributed route is advertised depends on how on the configuration of the `metric-style` command. If the `metric-style` command is set for Narrow mode and the metric value in the `redistribute ospf` command is set to a number higher than 63, the metric value advertised in LSPs is 63. If the `metric-style` command is set for wide mode, the metric value in the `redistribute ospf` command is advertised.

# router isis

Allows you to enable the IS-IS routing protocol and to specify an IP IS-IS process.

## S4820T

### Syntax

```
router isis [vrf vrf-name] [tag]
```

To disable IS-IS routing, use the `no router isis [tag]` command.

### Parameters

#### **vrf vrf-name**

Enter the keyword `vrf` followed by the name of the VRF to enable the IS-IS routing protocol and to specify an IP IS-IS process on that VRF.

#### **tag**

(OPTIONAL) This is a unique name for a routing process. A null tag is assumed if the `tag` option is not specified. The tag name must be unique for all IP router processes for a given router.

### Defaults

Not configured.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |

### Usage Information

Configure a network entity title (the `net` command) to specify the area address and the router system ID.

Enable routing on one or more interfaces to establish adjacencies and establish dynamic routing.

You can configure only one IS-IS routing process to perform Level 2 routing. A `level-1-2` designation performs Level 1 and Level 2 routing at the same time.

## Related Commands

- [ip router isis](#) — configures IS-IS routing processes for IP on interfaces and attaches an area designator to the routing process.
- [net](#) — configures an IS-IS network entity title (NET) for a routing process.
- [is-type](#) — assigns a type for a given area.

## set-overload-bit

To set the overload bit in zeroth fragment of non-pseudonode LSPs on the router, configure the router. This setting prevents other routers from using it as an intermediate hop in their shortest path first (SPF) calculations.

### Syntax

```
set-overload-bit
```

To return to the default values, use the `no set-overload-bit` command.

### Defaults

Not set.

### Command Modes

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                            |
|----------|----------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.            |
| 9.0.2.0  | Introduced on the S6000.               |
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.12.0 | Introduced on the S4810.               |
| 8.3.11.1 | Introduced on the Z9000.               |
| 7.8.1.0  | Added support for multi-topology ISIS. |
| 6.3.1.0  | Introduced.                            |

### Usage Information

Set the overload bit when a router experiences problems, such as a memory shortage due to an incomplete link state database which can result in an incomplete or inaccurate routing table. If you set the overload bit in its LSPs, other routers ignore the unreliable router in their SPF calculations until the router has recovered.

**NOTE:** Enables you to configure a single system wide value that is common for both IPv4 and IPv6 address.

## show config

Display the changes you made to the IS-IS configuration. Default values are not shown.

**Syntax** `show config`

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.1  | Introduced on the S4810.    |

**Example (Router-Isis)** The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
Dell(conf-router_isis)#show config
!
router isis
  clns host ISIS 49.0000.0001.F100.E120.0013.00
  log-adjacency-changes
  net 49.0000.0001.F100.E120.0013.00
!
  address-family ipv6 unicast
  maximum-paths 16
  multi-topology transition
  set-overload-bit
  spf-interval level-1 100 15 20
  spf-interval level-2 120 20 25
  exit-address-family
```

**Example (Address-Family\_IPv6)** The bold section identifies that Multi-Topology IS-IS is enabled in Transition mode.

```
Dell(conf-router_isis-af_ipv6)#show conf
!
address-family ipv6 unicast
maximum-paths 16
```

```

multi-topology transition
set-overload-bit
spf-interval level-1 100 15 20
spf-interval level-2 120 20 25
exit-address-family

```

## show isis database

Display the IS-IS link state database.

### S4820T

**Syntax** `show isis [vrf vrf-name] database [level-1 | level-2] [local] [detail | summary] [system-id] [lspid]`

#### Parameters

**vrf *vrf-name*** (Optional) Enter the keyword `vrf` followed by the name of the VRF to display IS-IS link state database corresponding to that VRF.

**NOTE:** If you do not specify this option, the IS-IS link state database corresponding to the default VRF are displayed.

**level-1** (OPTIONAL) Displays the Level 1 IS-IS link-state database.

**level-2** (OPTIONAL) Displays the Level 2 IS-IS link-state database.

**local** (OPTIONAL) Displays local link-state database information.

**detail** (OPTIONAL) Displays the detailed link-state database information of each LSP when specified. If not specified, a summary displays.

**summary** (OPTIONAL) Displays the summary of link-state database information when specified.

***lspid*** (OPTIONAL) Display only the specified LSP.

***system-id*** (OPTIONAL) Displays the link-state database for *system-id*.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Added supported for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                             |
| 9.2(0.2) | Introduced on the Z9000.                             |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.7.1  | Introduced on the S4810.                             |

### Usage Information

The following describes the `show isis database` command shown in the following example.

| Field                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS-IS Level-1/<br>Level-2 Link State Database | Displays the IS-IS link state database for Level 1 or Level 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LSPID                                         | <p>Displays the LSP identifier.</p> <p>The first six octets are the System ID of the originating router.</p> <p>The first six octets are the System ID of the originating router. The next octet is the pseudonode ID. If this byte is not zero, the LSP describes system links. If this byte is zero (0), the LSP describes the state of the originating router.</p> <p>The designated router for a LAN creates and floods a pseudonode LSP and describes the attached systems.</p> <p>The last octet is the LSP number. An LSP is divided into multiple LSP fragments if there is more data than cannot fit in a single LSP. Each fragment has a unique LSP number.</p> <p>An * after the LSPID indicates that the system originates an LSP where this command was issued.</p> |
| LSP Seq Num                                   | This value is the sequence number for the LSP that allows other systems to determine if they have received the latest information from the source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LSP Checksum                                  | This is the checksum of the entire LSP packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LSP Holdtime                                  | This value is the amount of time, in seconds, that the LSP remains valid. A zero holdtime indicates that this is a purged LSP and is being removed from the link state database. A value between brackets indicates the duration that the purged LSP stays in the database before being removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Field | Description                                                                                                                                                                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ATT   | This value represents the Attach bit. This value indicates that the router is a Level 1-2 router and can reach other areas. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 1-2 routers use the Attach bit to find the closest Level 1-2 router. They install a default route to the closest Level 1-2 router. |
| P     | This value represents the P bit. This bit is always set to zero as Dell Networking does not support area partition repair.                                                                                                                                                                                                                         |
| OL    | This value represents the overload bit, determining congestion. If the overload bit is set, other routers do not use this system as a transit router when calculating routes.                                                                                                                                                                      |

### Example

The bold sections identify that MultiTopology IS-IS is enabled.

```
Dell#show isis database

## show isis graceful-restart detail

Display detailed IS-IS graceful restart related settings.

### S4820T

#### Syntax

```
show isis [vrf vrf-name] graceful-restart detail
```

#### Command Modes

- EXEC
- EXEC Privilege

#### Parameters

**vrf vrf-name** (Optional) Enter the keyword vrf followed by the name if the VRF to display IS-IS graceful restart details corresponding to that VRF.

**NOTE:** If you do not specify this option, the IS-IS graceful restart details corresponding to the default VRF are displayed.

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.1.0  | Introduced on the E-Series. |

### Example

```
Dell#show isis graceful-restart detail
Configured Timer Value
=====
Graceful Restart      : Enabled
T3 Timer              : Manual
T3 Timeout Value     : 30
T2 Timeout Value     : 30 (level-1), 30 (level-2)
T1 Timeout Value     : 5, retry count: 1
Adjacency wait time  : 30

Operational Timer Value
=====
Current Mode/State   : Normal/RUNNING
T3 Time left         : 0
T2 Time left         : 0 (level-1), 0 (level-2)
Restart ACK rcv count : 0 (level-1), 0 (level-2)
Restart Req rcv count : 0 (level-1), 0 (level-2)
Suppress Adj rcv count : 0 (level-1), 0 (level-2)
Restart CSNP rcv count : 0 (level-1), 0 (level-2)
Database Sync count  : 0 (level-1), 0 (level-2)
```

## show isis hostname

Display IS-IS host names configured or learned on the switch.

### S4820T

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show isis [vrf vrf-name] hostname</code>                                                                                                                       |
| <b>Parameters</b>      | <p><b>vrf vrf-name</b> Enter the keyword vrf followed by the name of the VRF to display IS-IS host names corresponding to that VRF.</p>                              |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                       |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |

| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |

#### Example

```
Dell#show isis hostname
System Id      Dynamic Name Static Name
 *F100.E120.0013 Force10      ISIS
Dell#
```

## show isis interface

Display detailed IS-IS interface status and configuration information.

### S4820T

#### Syntax

```
show isis [vrf vrf-name] interface [interface]
```

#### Parameters

- |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vrf vrf-name</i></b> | (OPTIONAL) Enter the keyword <i>vrf</i> followed by the name of the VRF to display IS-IS interface status information corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>interface</i></b>    | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

#### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |

## Example

```
Dell>show isis int
TenGigabitEthernet 1/7 is up, line protocol is up
  MTU 1497, Encapsulation SAP
  Routing Protocol: IS-IS
  Circuit Type: Level-1-2
  Interface Index 37847070, Local circuit ID 1
  Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.01
  Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
  Number of active level-1 adjacencies: 1
  Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.01
  Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
  Number of active level-2 adjacencies: 1
  Next IS-IS LAN Level-1 Hello in 2 seconds
  Next IS-IS LAN Level-2 Hello in 1 seconds
  LSP Interval: 33
TenGigabitEthernet 1/8 is up, line protocol is up
  MTU 1497, Encapsulation SAP
  Routing Protocol: IS-IS
  Circuit Type: Level-1-2
  Interface Index 38371358, Local circuit ID 2
  Level-1 Metric: 10, Priority: 64, Circuit ID: systest-3.02
  Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
  Number of active level-1 adjacencies: 1
  Level-2 Metric: 10, Priority: 64, Circuit ID: systest-3.02
  Hello Interval: 10, Hello Multiplier: 3, CSNP Interval: 10
--More--
```

## show isis neighbors

Display information about neighboring (adjacent) routers.

### S4820T

#### Syntax

```
show isis [vrf vrf-name] neighbors [level-1 | level-2] [detail]
[interface]
```

## Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf <i>vrf-name</i></b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display adjacent router information corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>level-1</b>             | (OPTIONAL) Displays information about Level 1 IS-IS neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>level-2</b>             | (OPTIONAL) Displays information about Level 2 IS-IS neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>detail</b>              | (OPTIONAL) Displays detailed information about neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>interface</i></b>    | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |

## Usage Information

Use this command to confirm that the neighbor adjacencies are operating correctly. If you suspect that they are not, you can verify the specified area addresses of the routers by using the `show isis neighbors` command.

The following describes the `show isis neighbors` command shown in the following example.

| Field      | Description                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------|
| System Id  | The value that identifies a system in an area.                                                                              |
| Interface  | The interface, slot, and port in which the router was discovered.                                                           |
| State      | The value providing status about the adjacency state. The range is Up and Init.                                             |
| Type       | This value displays the adjacency type (Layer 2, Layer 2 or both).                                                          |
| Priority   | IS-IS priority the neighbor advertises. The neighbor with highest priority becomes the designated router for the interface. |
| Uptime     | Displays the interfaces uptime.                                                                                             |
| Circuit Id | The neighbor's interpretation of the designated router for the interface.                                                   |

### Example

The bold sections below identify that Multi-Topology IS-IS is enabled. This command displays only one IP address per line.

```
Dell#show isis neighbors
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2 (M) 127 09:28:01 TEST.02
!
Dell#show isis neighbors detail
System Id Interface State Type Priority Uptime Circuit Id
TEST Te 7/1 Up L1L2 (M) 127 09:28:04 TEST.02 Area Address(es):
49.0000.0001
  IP Address(es): 25.1.1.3*
  MAC Address: 0000.0000.0000
  Hold Time: 28
  Link Local Address: fe80::201:e8ff:fe00:492c
  Topology: IPv4 IPv6 , Common (IPv4 IPv6 )
  Adjacency being used for MTs: IPv4 IPv6
Dell#
```

## show isis protocol

Display IS-IS routing information.

### S4820T

#### Syntax

```
show isis [vrf vrf-name] protocol
```

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display IS-IS routing information corresponding to that VRF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |

**Example**

The bold section identifies that Multi-Topology IS-IS is enabled.

```
Dell#show isis protocol
IS-IS Router: <Null Tag>
  System Id: F100.E120.0013 IS-Type: level-1-2
  Manual area address(es):
    49.0000.0001
  Routing for area address(es):
    49.0000.0001
  Interfaces supported by IS-IS:
    TenGigabitEthernet 1/1 - IP - IPv6
    TenGigabitEthernet 1/2 - IP - IPv6
    TenGigabitEthernet 1/10 - IP - IPv6
    Loopback 0 - IP - IPv6
  Redistributing:
  Distance: 115
  Generate narrow metrics: level-1-2
  Accept narrow metrics:   level-1-2
  Generate wide metrics:   none
  Accept wide metrics:     none
Multi Topology Routing is enabled in transition mode.
Dell#
```

# show isis traffic

This command allows you to display IS-IS traffic interface information.

## S4820T

|                   |                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>show isis [vrf vrf-name] traffic [interface]</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Parameters</b> | <b>vrf vrf-name</b>                                       | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display IS-IS traffic interface information corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b>interface</b>                                          | (OPTIONAL) Identifies the interface type slot/port as one of the following: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| <b>Command Modes</b> | <ul style="list-style-type: none"><li>• EXEC</li><li>• EXEC Privilege</li></ul> |
|----------------------|---------------------------------------------------------------------------------|

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.2(0.2) | Introduced on the Z9000.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |

**Usage Information** The following describes the `show isis traffic` command shown in the following example.

| Item                                       | Description                                                     |
|--------------------------------------------|-----------------------------------------------------------------|
| Level-1/Level-2 Hellos (sent/rcvd)         | Displays the number of Hello packets sent and received.         |
| PTP Hellos (sent/rcvd)                     | Displays the number of point-to-point Hellos sent and received. |
| Level-1/Level-2 LSPs sourced (new/refresh) | Displays the number of new and refreshed LSPs.                  |
| Level-1/Level-2 LSPs flooded (sent/rcvd)   | Displays the number of flooded LSPs sent and received.          |
| Level-1/Level-2 LSPs CSNPs (sent/rcvd)     | Displays the number of CSNP LSPs sent and received.             |
| Level-1/Level-2 LSPs PSNPs (sent/rcvd)     | Displays the number of PSNP LSPs sent and received.             |
| Level-1/Level-2 DR Elections               | Displays the number of times designated router elections ran.   |
| Level-1/Level-2 SPF Calculations           | Displays the number of shortest path first calculations.        |
| LSP checksum errors received               | Displays the number of checksum errors LSPs received.           |
| LSP authentication failures                | Displays the number of LSP authentication failures.             |

### Example

```

Dell#show is traffic
IS-IS: Level-1 Hellos (sent/rcvd) : 0/721
IS-IS: Level-2 Hellos (sent/rcvd) : 900/943
IS-IS: PTP Hellos (sent/rcvd) : 0/0
IS-IS: Level-1 LSPs sourced (new/refresh) : 0/0
IS-IS: Level-2 LSPs sourced (new/refresh) : 1/3
IS-IS: Level-1 LSPs flooded (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs flooded (sent/rcvd) : 5934/5217
IS-IS: Level-1 LSPs CSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs CSNPs (sent/rcvd) : 472/238
IS-IS: Level-1 LSPs PSNPs (sent/rcvd) : 0/0
IS-IS: Level-2 LSPs PSNPs (sent/rcvd) : 10/337
IS-IS: Level-1 DR Elections : 4
IS-IS: Level-2 DR Elections : 4
IS-IS: Level-1 SPF Calculations : 0
IS-IS: Level-2 SPF Calculations : 389
IS-IS: LSP checksum errors received : 0
IS-IS: LSP authentication failures : 0
Dell#

```

# spf-interval

Specify the minimum interval between shortest path first (SPF) calculations.

**Syntax** `spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]`  
To restore default values, use the `no spf-interval [level-1 | level-2] interval seconds [initial_wait_interval seconds [second_wait_interval seconds]]` command.

|                   |                                      |                                                                                                                                                                      |
|-------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>level-1</b>                       | (OPTIONAL) Enter the keyword <code>level-1</code> to apply the configuration to Level-1 SPF calculations.                                                            |
|                   | <b>level-2</b>                       | (OPTIONAL) Enter the keyword <code>level-2</code> to apply the configuration to Level-2 SPF calculations.                                                            |
|                   | <b>interval seconds</b>              | Enter the maximum number of seconds between SPF calculations. The range is from 0 to 120 seconds. The default is <b>10 seconds</b> .                                 |
|                   | <b>initial_wait_interval seconds</b> | (OPTIONAL) Enter the initial wait time, in seconds, before running the first SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |
|                   | <b>second_wait_interval seconds</b>  | (OPTIONAL) Enter the wait interval, in seconds, between the first and second SPF calculations. The range is from 0 to 120 seconds. The default is <b>5 seconds</b> . |

**Defaults** Refer to *Parameters*.

**Command Modes**

- ROUTER ISIS (*for IPv4*)
- CONFIGURATION-ROUTER-ISIS-ADDRESS-FAMILY-IPV6 (*for IPv6*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |

| Version | Description                                   |
|---------|-----------------------------------------------|
| 7.8.1.0 | Added support for multi-topology ISIS.        |
| 7.5.1.0 | Added support for SPF Throttling Enhancement. |

### Usage Information

This command `spf-interval` in CONFIG-ROUTER-ISIS-AF-IPV6 mode is used for IPv6 Multi-Topology route computation only. If using Single Topology mode, use the `spf-interval` command in CONFIG-ROUTER-ISIS mode for both IPv4 and IPv6 route computations.

SPF throttling slows down the frequency at which route calculations are performed during network instability. Even though throttling route calculations slows down network convergence, not throttling can result in a network not functioning as expected. If network topology is unstable, throttling slows down the scheduling of route calculations until the topology regains its stability.

The first route calculation is controlled by the initial wait interval and the second calculation is controlled by the second wait interval. Each subsequent wait interval is twice as long as the previous one until the wait interval reaches the maximum wait time specified (`interval seconds`). After the network calms down and there are no triggers for two times the maximum interval, fast behavior is restored (the initial wait time).

# Link Aggregation Control Protocol (LACP)

This chapter contains commands for Dell Networks's implementation of the link aggregation control protocol (LACP) for creating dynamic link aggregation groups (LAGs) — known as “port-channels” in the Dell Networking operating software. The LACP commands in this chapter are supported by Dell Networking OS on the S4820T platform.

 **NOTE:** For static LAG commands, refer to [Port Channel Commands](#) in the [Interfaces](#) chapter), based on the standards specified in the IEEE 802.3 Carrier sense multiple access with collision detection (CSMA/CD) access method and physical layer specifications.

## clear lacp counters

Clear port channel counters.

### S4820T

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear lacp <i>port-channel-number</i> counters</code>                                                                                                                                                                                                     |
| <b>Parameters</b>      | <i>port-channel-number</i> Enter a port-channel number. The range is from 1 to 128.                                                                                                                                                                             |
| <b>Defaults</b>        | Without a Port Channel specified, the command clears all Port Channel counters.                                                                                                                                                                                 |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                                                                                                                  |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |

| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Related Commands**      [show lacp](#) — displays the LACP configuration.

## debug lacp

Debug LACP (configuration, events, and so on).

### S4820T

**Syntax**      `debug lacp [config | events | pdu [interface-type [in | out]]]`  
 To disable LACP debugging, use the `no [config | events | pdu [interface-type [in | out]]]` command.

**Parameters**

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>config</b>                             | (OPTIONAL) Enter the keyword <code>config</code> to debug the LACP configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>events</b>                             | (OPTIONAL) Enter the keyword <code>events</code> to debug the LACP event information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.2.1.1  | Introduced on the E-Series.                          |

## lacp long-timeout

Configure a long timeout period (30 seconds) for an LACP session.

### S4820T

**Syntax**

```
lacp long-timeout
```

To reset the timeout period to a short timeout (1 second), use the `no lacp long-timeout` command.

**Defaults**

**1 second**

**Command Modes**

INTERFACE (conf-if-po-number)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information**

This command applies to dynamic port-channel interfaces only. When applied on a static port-channel, this command has no effect.

**Related Commands**

[show lacp](#) — displays the LACP configuration.

## lacp port-priority

To influence which ports will be put in Standby mode when there is a hardware limitation that prevents all compatible ports from aggregating, configure the port priority.

### S4820T

**Syntax**

`lacp port-priority priority-value`

To return to the default setting, use the `no lacp port-priority priority-value` command.

**Parameters**

***priority-value*** Enter the port-priority value. The higher the value number, the lower the priority. The range is from 1 to 65535. The default is **32768**.

**Defaults**

**32768**

**Command Modes**

**Related Commands**

[clear lacp counters](#) — clears the LACP counters.

[show interfaces port-channel](#) — displays information on configured Port Channel groups.

## Layer 2

This chapter describes commands to configure Layer 2 features.

This chapter contains the following sections:

- [MAC Addressing Commands](#)
- [Virtual LAN \(VLAN\) Commands](#)
- [Far-End Failure Detection \(FEFD\)](#)

The VLAN commands are supported on all the S4820T platform.

### MAC Addressing Commands

The following commands are related to configuring, managing, and viewing MAC addresses.

#### clear mac-address-table

Clear the MAC address table of all MAC address learned dynamically.

#### S4820T

**Syntax** `clear mac-address-table {dynamic | sticky }{address mac-address | all | interface interface | vlan vlan-id}`

| Parameters |                                   |                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>dynamic</b>                    | Enter the keyword <code>dynamic</code> to specify dynamically-learned MAC addresses.                                                                                                                                                                                                                                                                                          |
|            | <b>sticky</b>                     | Enter the keyword <code>sticky</code> to specify sticky MAC addresses.                                                                                                                                                                                                                                                                                                        |
|            | <b>address <i>mac-address</i></b> | Enter the keyword <code>address</code> then a MAC address in <code>nn:nn:nn:nn:nn:nn</code> format.                                                                                                                                                                                                                                                                           |
|            | <b>all</b>                        | Enter the keyword <code>all</code> to delete all MAC address entries in the MAC address table.                                                                                                                                                                                                                                                                                |
|            | <b>interface <i>interface</i></b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> </ul> |

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**vlan *vlan-id*** Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.2(1.0) | Introduced on the Z9500.                             |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.12.0 | Added support for sticky MAC addresses.              |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.1.1.1  | Introduced on the E-Series.                          |

## mac-address-table aging-time

Specify an aging time for MAC addresses to remove from the MAC address table.

### S4820T

**Syntax**

`mac-address-table aging-time seconds`

**Parameters**

**seconds** Enter either zero (0) or a number as the number of seconds before MAC addresses are relearned. To disable aging of the MAC address table, enter 0. The range is from 10 to 1000000. The default is **1800 seconds**.

**Defaults**

**1800 seconds**

**Command Modes**

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                                                                                     |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                                                                                                                     |
| 9.0.2.0     | Introduced on the S6000.                                                                                                                        |
| 8.3.19.0    | Introduced on the S4820T.                                                                                                                       |
| 8.3.11.1    | Introduced on the Z9000.                                                                                                                        |
| 8.3.7.0     | Introduced on the S4810.                                                                                                                        |
| 8.3.1.0     | On the E-Series, available in INTERFACE VLAN context, reduced the minimum aging time in the INTERFACE VLAN context from 10 seconds to 1 second. |
| 7.6.1.0     | Introduced on the S-Series.                                                                                                                     |
| 7.5.1.0     | Introduced on the C-Series.                                                                                                                     |
| pre-6.2.1.1 | Introduced on the E-Series.                                                                                                                     |

## Related Commands

[mac learning-limit](#) — sets the MAC address learning limits for a selected interface.

[show mac-address-table aging-time](#) — displays the MAC aging time.

## mac-address-table static

Associate specific MAC or hardware addresses to an interface and VLANs.

### S4820T

#### Syntax

```
mac-address-table static mac-address {multicast vlan vlan-id
output-range interface} {output interface vlan vlan-id}
```

To remove a MAC address, use the `no mac-address-table static mac-address output interface vlan vlan-id` command.

#### Parameters

***mac-address*** Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.

***multicast*** Enter a vlan port to where L2 multicast MAC traffic is forwarded.

**NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>output<br/>interface</b>       | For a unicast MAC address, enter the keyword <code>output</code> then one of the following interfaces for which traffic is forwarded: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul>          |
| <b>output-range<br/>interface</b> | For a multicast MAC address, enter the keyword <code>output-range</code> then one of the following interfaces to indicate a range of ports for which traffic is forwarded: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> </ul> |
| <b>vlan <i>vlan-id</i></b>        | Enter the keyword <code>vlan</code> then a VLAN ID number from 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b> | <b>Description</b>                                            |
|----------------|---------------------------------------------------------------|
| 9.7(0.0)       | Introduced on the S6000-ON.                                   |
| 9.2(1.0)       | Introduced on the Z9500.                                      |
| 9.0.2.0        | Introduced on the S6000.                                      |
| 9.1(0.0)       | Added support for output range parameter for S4810 and Z9000. |
| 8.3.19.0       | Introduced on the S4820T.                                     |
| 8.3.11.1       | Introduced on the Z9000.                                      |
| 8.5.1.0        | Added support for 4-port 40G line cards on ExaScale.          |
| 8.3.7.0        | Introduced on the S4810.                                      |
| 7.6.1.0        | Introduced on the S-Series.                                   |
| 7.5.1.0        | Introduced on the C-Series.                                   |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.2.1.1 | Introduced on the E-Series. |

|                            |                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------|
| <b>Example (Unicast)</b>   | <code>mac-address-table static 00:01:00:00:00:01 {output Te 1/2 vlan 2}</code>                        |
| <b>Example (Multicast)</b> | <code>mac-address-table static 01:00:5E:01:00:01 {multicast vlan 2 output-range Te 1/2,Te 1/3}</code> |
| <b>Related Commands</b>    | <a href="#">show mac-address-table</a> — displays the MAC address table.                              |

## mac-address-table station-move threshold

Change the frequency with which the MAC address station-move trap is sent after a MAC address changes in a VLAN. A trap is sent if a station move is detected above a threshold number of times in a given interval.

### S4820T

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                      |                                |                                                                                                                                                             |                                |                                                                                                |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

|                          |                                                                                                                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | For information about the specific trap sent and the corresponding Syslog, refer to the <a href="#">SNMP Traps</a> chapter. |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------|

## mac-address-table station-move refresh-arp

Ensure that address resolution protocol (ARP) refreshes the egress interface when a station move occurs due to a topology change.

### S4820T

**Syntax** `[no] mac-address-table station-move refresh-arp`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

**Usage Information** For details about using this command, refer to the “NIC Teaming” section of the Layer 2 chapter in the *Dell Networking OS Configuration Guide*.

## mac learning-limit

Limit the maximum number of MAC addresses (static + dynamic) learned on a selected interface.

### S4820T

**Syntax** `mac learning-limit address_limit [vlan vlan-id] [station-move-violation [dynamic]] [dynamic [no-station-move| station-move]]`

**Parameters**

|                             |                                                                                                                 |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b><i>address_limit</i></b> | Enter the maximum number of MAC addresses that can be learned on the interface. The range is from 1 to 1000000. |
| <b>vlan <i>vlan-id</i></b>  | Enter the keyword then the VLAN ID. The range is from 1 to 4094.                                                |

- dynamic** (OPTIONAL) Enter the keyword `dynamic` to allow aging of MACs even though a learning limit is configured.
- station-move-violation** (OPTIONAL) Enter the keywords `station-move` to allow a station move on learned MAC addresses.

**Defaults**

- On S-Series, the default behavior is `dynamic`.

**NOTE:** "Static" means manually entered addresses, which do not age.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                                       |
| 9.0.2.0  | Introduced on the S6000.                                                                                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                         |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                          |
| 8.3.12.0 | Deprecated the <code>no-station-move</code> command (replaced by the <code>mac-learning-limit mac-address-sticky</code> command). |
| 8.3.7.0  | Introduced on the S4810.                                                                                                          |
| 8.3.1.0  | Added the <code>vlan</code> option on the E-Series.                                                                               |
| 8.2.1.0  | Introduced on the S-Series.                                                                                                       |
| 7.7.1.0  | Introduced on the C-Series. Added the <code>station-move</code> option.                                                           |
| 6.5.1.0  | Added support for MAC Learning-Limit on the LAG.                                                                                  |

**Usage Information**

This command and its options are supported on physical interfaces, static LAGs, LACP LAGs, and VLANs.

If you do not specify the `vlan` option, the MAC address counters are not VLAN-based. That is, the sum of the addresses learned on all VLANs (not having any learning limit configuration) is counted against the MAC learning limit.

MAC Learning Limit violation logs and actions are not available on a per-VLAN basis.

With the keyword `no-station-move` option, MAC addresses learned through this feature on the selected interface persist on a per-VLAN basis, even if received on

another interface. Enabling or disabling this option has no effect on already learned MAC addresses.

After the MAC address learning limit is reached, the MAC addresses do not age out unless you add the `dynamic` option. To clear statistics on MAC address learning, use the `clear counters` command with the `learning-limit` parameter.

**NOTE:** If you configure this command on an interface in a routed VLAN, and after the MAC addresses learned reaches the limit set in the `mac learning-limit` command, IP protocols are affected. For example, VRRP sets multiple VRRP Masters and OSPF may not come up.

When a channel member is added to a port-channel and there is not enough ACL CAM space, the MAC limit functionality on that port-channel is undefined. When this occurs, un-configure the existing configuration first and then reapply the limit with a lower value.

#### Related Commands

[mac learning-limit mac-address-sticky](#) — Replaces deprecated `no-station-move` parameter.

[show mac learning-limit](#) — displays MAC learning-limit configuration.

## mac learning-limit learn-limit-violation

Configure an action for a MAC address learning-limit violation.

### S4820T

#### Syntax

```
mac learning-limit learn-limit-violation {log | shutdown}
```

To return to the default, use the `no mac learning-limit learn-limit-violation {log | shutdown}` command.

#### Parameters

- |                 |                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------|
| <b>log</b>      | Enter the keyword <code>log</code> to generate a syslog message on a learning-limit violation. |
| <b>shutdown</b> | Enter the keyword <code>shutdown</code> to shut down the port on a learning-limit violation.   |

#### Defaults

none

#### Command Modes

INTERFACE (conf-if-interface-slot/port)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.2.1.0  | Introduced on the S-Series. |
| 7.8.1.0  | Introduced on the C-Series. |
| 7.5.1.0  | Introduced on the E-Series. |

**Usage Information**

This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands**

[show mac learning-limit](#) — displays details of the mac learning-limit.

## mac learning-limit mac-address-sticky

Maintain the dynamically learned mac addresses as sticky MAC addresses on the selected port.

### S4820T

**Syntax**

`mac learning-limit mac-address-sticky`

To convert the sticky MAC addresses to dynamic MAC addresses, use the `no mac learning-limit` command.

**Parameters**

|                                  |                                                                 |
|----------------------------------|-----------------------------------------------------------------|
| <b><i>mac-address-sticky</i></b> | Configures the dynamic MAC addresses as sticky on an interface. |
|----------------------------------|-----------------------------------------------------------------|

**Defaults**

none

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description              |
|----------|--------------------------|
| 8.3.11.1 | Introduced on the Z9000. |
| 8.3.12.0 | Introduced on the S4810. |

|                          |                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | If you configure <code>mac-learning-limit</code> and the sticky MAC feature is enabled, dynamically learned MAC addresses are converted to sticky for that port. Any new MAC address that is learned also becomes sticky for that port. |
| <b>Related Commands</b>  | <a href="#">show mac learning-limit</a> – displays the details of the mac learning-limit.                                                                                                                                               |

## mac learning-limit station-move-violation

Specify the actions for a station move violation.

### S4820T

|               |                                                                                                                                                                                                                                                              |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>mac learning-limit station-move-violation {log   shutdown-both   shutdown-offending   shutdown-original}</code><br>To disable a configuration, use the <code>no mac learning-limit station-move-violation</code> command, then the configured keyword. |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><b>log</b> Enter the keyword <code>log</code> to generate a syslog message on a station move violation.</p> <p><b>shutdown-both</b> Enter the keyword <code>shutdown</code> to shut down both the original and offending interface and generate a syslog message.</p> <p><b>shutdown-offending</b> Enter the keywords <code>shutdown-offending</code> to shut down the offending interface and generate a syslog message.</p> <p><b>shutdown-original</b> Enter the keywords <code>shutdown-original</code> to shut down the original interface and generate a syslog message.</p> |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** none

**Command Modes** INTERFACE (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.2.1.0  | Introduced on the S-Series. |
| 7.8.1.0  | Introduced on the C-Series. |
| 7.5.1.0  | Introduced on the E-Series. |

**Usage Information**

This command is supported on physical interfaces, static LAGs, and LACP LAGs.

**Related Commands**

[show mac learning-limit](#) — displays details of the mac learning-limit.

## mac learning-limit reset

Reset the MAC address learning-limit error-disabled state.

### S4820T

**Syntax** `mac learning-limit reset`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| 8.3.7.0  | Introduced on the S4810.    |
| 8.2.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |
| 7.5.1.0  | Introduced on the E-Series. |

## show cam mac linecard (count)

Display the content addressable memory (CAM) size and the portions allocated for MAC addresses and for MAC ACLs.

### S4820T

**Syntax** `show cam mac linecard slot port-set port-pipe count [vlan vlan-id] [interface interface]`

|                   |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>linecard slot</b>       | (REQUIRED) Enter the keyword <code>linecard</code> then a slot number to select the linecard for which to gather information.                                                                                                                                                                                                                                                                                                                                                                                |
|                   | <b>port-set port-pipe</b>  | (REQUIRED) Enter the keywords <code>port-set</code> then a Port-Pipe number to select the Port-Pipe for which to gather information.                                                                                                                                                                                                                                                                                                                                                                         |
|                   | <b>count</b>               | (REQUIRED) Enter the keyword <code>count</code> to display CAM usage by interface type.                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                   | <b>interface interface</b> | (OPTIONAL) Enter the keyword <code>interface</code> then the interface type, slot and port information: <ul style="list-style-type: none"><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |
|                   | <b>vlan vlan-id</b>        | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                |

|                      |                                                                                 |
|----------------------|---------------------------------------------------------------------------------|
| <b>Command Modes</b> | <ul style="list-style-type: none"><li>• EXEC</li><li>• EXEC Privilege</li></ul> |
|----------------------|---------------------------------------------------------------------------------|

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.2.1.1 | Introduced on the E-Series. |

## show cam mac linecard (dynamic or static)

Display the CAM size and the portions allocated for MAC addresses and for MAC ACLs.

### S4820T

**Syntax** `show cam mac linecard slot port-set port-pipe [address mac_addr | dynamic | interface interface | static | vlan vlan-id]`

#### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>linecard slot</b>       | (REQUIRED) Enter the keyword <code>linecard</code> then a slot number to select the linecard for which to gather information.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>port-set port-pipe</b>  | (REQUIRED) Enter the keywords <code>port-set</code> then a Port-Pipe number to select the Port-Pipe for which to gather information. The range is from 0 or 1.                                                                                                                                                                                                                                                                                                                                             |
| <b>address mac-addr</b>    | (OPTIONAL) Enter the keyword <code>address</code> then a MAC address in the <code>nn:nn:nn:nn:nn:nn</code> format to display information on that MAC address.                                                                                                                                                                                                                                                                                                                                              |
| <b>dynamic</b>             | (OPTIONAL) Enter the keyword <code>dynamic</code> to display only those MAC addresses the switch dynamically learns.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>interface interface</b> | (OPTIONAL) Enter the keyword <code>interface</code> then the interface type, slot and port information: <ul style="list-style-type: none"> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
| <b>static</b>              | (OPTIONAL) Enter the keyword <code>static</code> to display only those MAC addresses specifically configured on the switch.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>vlan vlan-id</b>        | (OPTIONAL) Enter the keyword <code>vlan</code> then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                   |

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

### Example

```
Dell#show cam mac linecard 1 port-set 0
Port - (TableID) assignments:

Dell#
```

## show mac-address-table

Display the MAC address table.

### S4820T

#### Syntax

```
show mac-address-table [address mac-address | interface
interface | vlan vlan-id] [aging-time] [dynamic | static]
[count [vlan vlan-id] [interface interface-type [slot [/
port]]]]
```

#### Parameters

|                                   |                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>address <i>mac-address</i></b> | (OPTIONAL) Enter the keyword <code>address</code> then a MAC address in the <code>nn:nn:nn:nn:nn:nn</code> format to display information on that MAC address.                |
| <b>dynamic</b>                    | (OPTIONAL) Enter the keyword <code>dynamic</code> to display only those MAC addresses the switch dynamically learns. Optionally, you can also add one of these combinations: |

*address/mac-address, interface/interface, or vlan vlan-id.*

**static** (OPTIONAL) Enter the keyword `static` to display only those MAC addresses specifically configured on the switch. Optionally, you can also add one of these combinations: *address/mac-address, interface/interface, or vlan vlan-id.*

**aging-time** Enter the keyword `aging-time` to display only aging-time information.

**interface interface** (OPTIONAL) Enter the keyword `interface` then the interface type, slot/port information:

- For a port channel interface, enter the keywords `port-channel` then a number.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**interface interface-type** (OPTIONAL) Instead of entering the keyword `interface` then the interface type, slot/port information, as above, you can enter the interface type, then just a slot number.

**vlan vlan-id** (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is 1 to 4094.

**count** (OPTIONAL) Enter the keyword `count`, then optionally, by an interface or VLAN ID, to display total or interface-specific static addresses, dynamic addresses, and MAC addresses in use.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Updated the output.         |

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

**Usage Information**

The following describes the `show mac-address-table` command shown in the following example.

| Column Heading     | Description                                                                                                                                                                                                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VlanId</b>      | Displays the VLAN ID number.                                                                                                                                                                                                                                                                                                                             |
| <b>Mac Address</b> | Displays the MAC address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                                                                                                                    |
| <b>Type</b>        | Lists whether the MAC address was manually configured (Static), learned dynamically (Dynamic), or associated with a specific port (Sticky).                                                                                                                                                                                                              |
| <b>Interface</b>   | Displays the interface type and slot/port information. The following abbreviations describe the interface types: <ul style="list-style-type: none"> <li>• gi — Gigabit Ethernet then a slot/port.</li> <li>• po — Port Channel then a number. The range is from 1 to 255 for TeraScale.</li> <li>• te — 10 Gigabit Ethernet then a slot/port.</li> </ul> |
| <b>State</b>       | Lists if the MAC address is in use (Active) or not in use (Inactive).                                                                                                                                                                                                                                                                                    |

**Example**

```
Dell(conf)#do show mac-address-table
Codes: *N - VLT Peer Synced MAC
VlanId   Mac
Address  Type      Interface      State
2        00:00:00:00:00:01  Dynamic (N)    Po
128      Active
2        00:00:00:00:00:02  Dynamic (N)    Po
10       Active
2        00:00:00:00:00:03  Dynamic        Po
100     Active
2        00:00:00:00:00:04  Dynamic        Po
10       Active
```

**Usage Information**

The following describes the `show mac-address-table` command shown in the following example.

| Column Heading     | Description                                           |
|--------------------|-------------------------------------------------------|
| <b>VlanId</b>      | Displays the VLAN ID number.                          |
| <b>Mac Address</b> | Displays the MAC address in nn:nn:nn:nn:nn:nn format. |

| Column Heading | Description                                                                                                                                                                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type           | Lists whether the MAC address was manually configured (Static), learned (Dynamic), or associated with a specific port (Sticky). An (N) indicates that the specified MAC address has been learnt by a neighbor and is synced to the node.                                                                                                                                   |
| Interface      | Displays the interface type and slot/port information. The following abbreviations describe the interface types: <ul style="list-style-type: none"> <li>• gi – Gigabit Ethernet followed by a slot/port</li> <li>• po – Port Channel followed by a number. Range for Terascale is from 1 to 255. \</li> <li>• te – 10-Gigabit Ethernet followed by a slot/port.</li> </ul> |
| State          | Lists if the MAC address is in use (Active) or not in use (Inactive).                                                                                                                                                                                                                                                                                                      |

The following describes the `show mac-address-table count` command shown in the following example.

| Line Beginning With | Description                                              |
|---------------------|----------------------------------------------------------|
| MAC Entries...      | Displays the number of MAC entries learned per VLAN.     |
| Dynamic Address...  | Lists the number of dynamically learned MAC addresses.   |
| Static Address...   | Lists the number of user-defined MAC addresses.          |
| Total MAC...        | Lists the total number of MAC addresses the switch uses. |

#### Example (Count)

```
Dell# show mac-address-table count
MAC Entries for all vlans :
Dynamic Address Count :          110
Static Address (User-defined) Count : 0
Sticky Address Count :          0
Total Synced Mac from Peer(N):    100
Total MAC Addresses in Use:       110
Dell#
```

#### Related Commands

[show mac-address-table aging-time](#) – displays MAC aging time.

## show mac-address-table aging-time

Display the aging times assigned to the MAC addresses on the switch.

### S4820T

**Syntax** `show mac-address-table aging-time [vlan vlan-id]`

**Parameters**

**vlan *vlan-id*** (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                         |
|-------------|-----------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                         |
| 9.0.2.0     | Introduced on the S6000.                            |
| 8.3.19.0    | Introduced on the S4820T.                           |
| 8.3.11.1    | Introduced on the Z9000.                            |
| 8.3.7.0     | Introduced on the S4810.                            |
| 8.3.1.0     | Added the <code>vlan</code> option on the E-Series. |
| 7.7.1.0     | Introduced on the C-Series and S-Series.            |
| pre-6.2.1.1 | Introduced on the E-Series.                         |

**Example**

```
Dell#show mac-address-table aging-time
Mac-address-table aging time : 1800

Dell#
```

**Related Commands**

[show mac-address-table](#) — displays the current MAC address configuration.

## show mac accounting destination

Display destination counters for Layer 2 traffic (available on physical interfaces only).

### S4820T

**Syntax**

```
show mac accounting destination [mac-address vlan vlan-id]
[interface interface [mac-address vlan vlan-id] [vlan vlan-id]]
[vlan vlan-id]
```

**Parameters**

***mac-address*** (OPTIONAL) Enter the MAC address in the nn:nn:nn:nn:nn:nn format to display information on that MAC address.

- interface**  
**interface** (OPTIONAL) Enter the keyword `interface` then the interface type, slot and port information:
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  
- vlan** *vlan-id* (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display the MAC address assigned to the VLAN. The range is from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

**Usage Information**

MAC Accounting information can be accessed using SNMP via the Force10 Monitor MIB. For more information about enabling SNMP, refer to the *Dell Networking OS Configuration Guide*.

**NOTE:** Currently, the Force10 MONITOR MIB does not return the MAC addresses in an increasing order using SNMP. As a workaround, you can use the `-C c` option in `snmpwalk` or `snmpbulkwalk` to access the Force10 MONITOR MIB. For example: `% snmpwalk -C c -v 2c -c public 133.33.33.131 enterprise.6027.3.3.3`

**Example**

```
Dell-1#show mac accounting destination interface
tengigabitethernet 2/1

Destination          Out Port  VLAN  Packets  Bytes
00:44:00:00:00:02    Te  11/1   1000   10000   5120000
00:44:00:00:00:01    Te  11/1   1000   10000   5120000
00:22:00:00:00:00    Te  11/1   1000   10000   5120000
00:44:00:00:00:02    Te  11/1   2000   10000   5120000
00:44:00:00:00:01    Te  11/1   2000   10000   5120000

Dell-1#
```

**Related Commands**      [show mac accounting access-list](#) — displays the MAC access list configurations and counters (if configured).

## show mac learning-limit

Display MAC address learning limits set for various interfaces.

### S4820T

**Syntax**                    `show mac learning-limit [violate-action] [detail] [interface interface]`

**Parameters**

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>violate-action</b>      | (OPTIONAL) Enter the keywords <code>violate-action</code> to display the MAC learning limit violation status.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>detail</b>              | (OPTIONAL) Enter the keyword <code>detail</code> to display the MAC learning limit in detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>interface interface</b> | (OPTIONAL) Enter the keyword <code>interface</code> with the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**                    This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.3.1.0  | Added the <code>vlan</code> option on the E-Series.  |

| Version | Description                                                                        |
|---------|------------------------------------------------------------------------------------|
| 7.7.1.0 | Introduced on the C-Series.                                                        |
| 7.5.1.0 | Added support for the <code>violate-action</code> and <code>detail</code> options. |
| 6.5.1.0 | Added support for Port Channel.                                                    |

### Example

```
Dell#show mac learning-limit
Interface Learning Dynamic Static Unknown SA
Slot/port Limit MAC count MAC count Drops
Te 1/1 10 0 0 0
Te 1/2 5 0 0 0
Dell#show mac learning-limit interface tengigabithethernet 1/1
Interface Learning Dynamic Static Unknown SA
Slot/port Limit MAC count MAC count Drops
Te 1/1 10 0 0 0
```

## Virtual LAN (VLAN) Commands

The following commands configure and monitor virtual LANs (VLANs). VLANs are a virtual interface and use many of the same commands as physical interfaces.

You can configure an IP address and Layer 3 protocols on a VLAN called Inter-VLAN routing. FTP, TFTP, ACLs and SNMP are not supported on a VLAN.

Occasionally, while sending broadcast traffic over multiple Layer 3 VLANs, the VRRP state of a VLAN interface may continually switch between Master and Backup.

 **NOTE:** For more information, refer to [VLAN Stacking](#) and VLAN-related commands, such as [portmode hybrid](#) in the [Interfaces](#) chapter.

### default vlan-id

Specify a VLAN as the Default VLAN.

#### S4820T

##### Syntax

```
default vlan-id vlan-id
```

To remove the default VLAN status from a VLAN and VLAN 1 does not exist, use the `no default vlan-id vlan-id` syntax.

##### Parameters

***vlan-id***

Enter the VLAN ID number of the VLAN to become the new Default VLAN. The range is from 1 to 4094. The default is **1**.

##### Defaults

The Default VLAN is VLAN **1**.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

**Usage Information** To return VLAN 1 as the Default VLAN, use this command syntax (`default-vlan-id 1`).

The Default VLAN contains only untagged interfaces.

**Related Commands** [interface vlan](#) — configures a VLAN.

## default-vlan disable

Disable the default VLAN so that all switchports are placed in the Null VLAN until they are explicitly configured as a member of another VLAN.

### S4820T

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.1.0  | Introduced                |

**Usage Information**

The `no default vlan disable` command is not listed in the running-configuration, but when the default VLAN is disabled, `default-vlan disable` is listed in the running-configuration.

**name**

Assign a name to the VLAN.

**S4820T**

**Syntax**

`name vlan-name`

To remove the name from the VLAN, use the `no name` command.

**Parameters**

***vlan-name*** Enter up to 32 characters as the name of the VLAN.

**Defaults**

Not configured.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

|                          |                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To display information about a named VLAN, enter the <code>show vlan</code> command with the name parameter or the <code>show interfaces description</code> command. |
| <b>Related Commands</b>  | <p><a href="#">interface vlan</a> — configures a VLAN.</p> <p><a href="#">show vlan</a> — displays the current VLAN configurations on the switch.</p>                |

## show config

Display the current configuration of the selected VLAN.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.                                                                                                                                       |
| 9.0.2.0   | Introduced on the S6000.                                                                                                                                          |
| 9.1.(0.0) | Updated to support OpenFlow.                                                                                                                                      |
| 8.3.19.0  | Introduced on the S4820T.                                                                                                                                         |
| 8.3.11.1  | Introduced on the Z9000.                                                                                                                                          |
| 8.3.7.0   | Introduced on the S4810.                                                                                                                                          |
| 7.8.1.0   | Augmented to display PVLAN data for the C-Series and S-Series and revised the output to include the Description field to display a user-entered VLAN description. |

| Version     | Description                                                               |
|-------------|---------------------------------------------------------------------------|
| 7.6.1.0     | Introduced on the S-Series and revised the output to display Native VLAN. |
| 7.5.1.0     | Introduced on the C-Series.                                               |
| pre-6.2.1.1 | Introduced on the E-Series.                                               |

### Usage Information

The following describes the `show vlan` command shown in the following example.

| Column Heading          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (Column 1 – no heading) | <ul style="list-style-type: none"> <li>• asterisk symbol (*) = Default VLAN</li> <li>• G = GVRP VLAN</li> <li>• P = primary VLAN</li> <li>• C = community VLAN</li> <li>• I = isolated VLAN</li> <li>• O = OpenFlow</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                |
| NUM                     | Displays existing VLAN IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Status                  | Displays the word <i>Inactive</i> for inactive VLANs and the word <i>Active</i> for active VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Ports                   | Displays the type, slot, and port information. <ul style="list-style-type: none"> <li>• Po = port channel</li> <li>• Gi = gigabit Ethernet</li> <li>• Te = ten-gigabit Ethernet</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Example

```
Dell#show vlan
```

```
Codes: * - Default VLAN, G - GVRP VLANs, P - Primary, C -
```

```

Community, I - Isolated
Q: U - Untagged, T - Tagged, O - Openflow
  x - Dot1x untagged, X - Dot1x tagged
  o - OpenFlow untagged, O - OpenFlow tagged
  G - GVRP tagged, M - Vlan-stack
  i - Internal untagged, I - Internal tagged, v - VLT
untagged, V - VLT tagged

```

#### Example (OpenFlow instance)

```
NUM Status Description Q Ports
* 1 Inactive
3 Inactive
0 6 Inactive
0 8 Inactive
0 12 Inactive O Te 1/10
```

#### Related Commands

[vlan-stack compatible](#) — enables the Stackable VLAN feature on the selected VLAN.

[interface vlan](#) — configures a VLAN.

## tagged

Add a Layer 2 interface to a VLAN as a tagged interface.

### S4820T

#### Syntax

```
tagged interface
```

To remove a tagged interface from a VLAN, use the `no tagged interface` command.

#### Parameters

##### *interface*

Enter the following keywords and slot/port or number information:

- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

All interfaces in Layer 2 mode are untagged.

**Command Modes**

INTERFACE VLAN

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                          |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

**Usage Information**

When you use the `no tagged` command, the interface is automatically placed in the Default VLAN as an untagged interface unless the interface is a member of another VLAN. If the interface belongs to several VLANs, remove it from all VLANs to change it to an untagged interface.

Tagged interfaces can belong to multiple VLANs, while untagged interfaces can only belong to one VLAN at a time.

**Related Commands**

[interface vlan](#) — configures a VLAN.

[untagged](#) — specifies which interfaces in a VLAN are untagged.

## track ip

Track the Layer 3 operational state of a Layer 3 VLAN, using a subset of the VLAN member interfaces.

### S4820T

**Syntax**

`track ip interface`

To remove the tracking feature from the VLAN, use the `no track ip interface` command.

#### Parameters

- interface*** Enter the following keywords and slot/port or number information:
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

#### Defaults

Not configured.

#### Command Modes

INTERFACE VLAN

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                          |
| 9.2(1.0)    | Introduced on the Z9500.                             |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

#### Usage Information

When this command is configured, the VLAN is operationally UP if any of the interfaces specified in the `track ip` command are operationally UP, and the VLAN is operationally DOWN if none of the tracking interfaces are operationally UP.

If the `track ip` command is not configured, the VLAN's Layer 3 operational state depends on all the members of the VLAN.

The Layer 2 state of the VLAN, and hence the Layer 2 traffic, is not affected by the `track ip` command configuration.

**Related  
Commands**

[interface vlan](#) — configures a VLAN.

[tagged](#) — specifies which interfaces in a VLAN are tagged.

## untagged

Add a Layer 2 interface to a VLAN as an untagged interface.

### S4820T

**Syntax**

`untagged interface`

To remove an untagged interface from a VLAN, use the `no untagged interface` command.

**Parameters**

***interface***

Enter the following keywords and slot/port or number information:

- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults**

All interfaces in Layer 2 mode are untagged.

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.2(1.0) | Introduced on the Z9500.                             |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |

| Version     | Description                 |
|-------------|-----------------------------|
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

Untagged interfaces can only belong to one VLAN.

In the Default VLAN, you cannot use the `no untagged interface` command. To remove an untagged interface from all VLANs, including the Default VLAN, enter INTERFACE mode and use the `no switchport` command.

#### Related Commands

[interface vlan](#) — configures a VLAN.

[tagged](#) — specifies which interfaces in a VLAN are tagged.

## Far-End Failure Detection (FEFD)

The Dell Networking operating software supports far-end failure detection (FEFD) on the Ethernet interfaces of the S4820T platform.

The FEFD feature detects and reports far-end link failures.

- FEFD is not supported on the Management interface.
- During an RPM failover, FEFD is operationally disabled for approximately 8 to 10 seconds.
- By default, FEFD is disabled.

### debug fefd

Enable debugging of FEFD.

#### S4820T

##### Syntax

```
debug fefd {events | packets} [interface]
```

To disable debugging of FEFD, use the `no debug fefd {events | packets} [interface]` command.

##### Parameters

|                         |                                                                                                                      |
|-------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>events</b>           | Enter the keyword <code>events</code> to enable debugging of FEFD state changes.                                     |
| <b>packets</b>          | Enter the keyword <code>packets</code> to enable debugging of FEFD to view information on packets sent and received. |
| <b><i>interface</i></b> | (OPTIONAL) Enter the following keywords and slot/port or number information:                                         |

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |

Legacy E-Series command.

**Related Commands**

- [fefd](#) — enables far-end failure detection on an interface.
- [fefd reset](#) — enables FEFD globally on the system.

## fefd

Enable Far-End Failure Detection on an interface, set the FEFD interval, or select the FEFD mode.

### S4820T

**Syntax**

```
fefd {disable|interval|mode {aggressive|normal}}
```

**Parameters**

- disable** Enter the keyword **disable** to disable FEFD for the specified interface.
- interval** Enter the keyword **interval**, followed by a value to specify the FEFD interval in seconds. Range is from 3 to 300. Default is 15.
- mode** Enter the keyword **mode** followed by the mode type to specify the FEFD mode.
  - **normal**: Change the link state to “unknown” when a far-end failure is detected by the software on that interface. When the interface is placed in an “unknown” state, the software brings down the line protocol.

- **aggressive:** Change the link state to “error-disabled” when a far-end failure is detected by the software on that interface. When an interface is placed in an “error-disabled” state, you must enter the `fefd reset` command to reset the interface state. Range is normal or aggressive. Default is normal.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |

**Usage Information** When you enter `no fefd` for an interface and `fefd-global`, FEFD is enabled on the interface because the `no fefd` command is not retained in the configuration file. To keep the interface FEFD disabled when the global configuration changes, use the `fefd reset` command.

**Related Commands**

- [fefd disable](#) — disables far-end failure detection on an interface.
- [fefd reset](#) — enables FEFD globally on the system.
- [fefd mode](#) — changes FEFD mode on an interface.

## fefd disable

Disable FEFD on an interface only. This command overrides the `fefd reset` command for the interface.

### S4820T

**Syntax** `fefd disable`  
To re-enable FEFD on an interface, use the `no fefd disable` command.

**Defaults** Not configured.

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

Legacy E-Series command.

## Usage Information

When you enter `no fefd` for an interface and `fefd-global`, FEFD is enabled on the interface because the `no fefd` command is not retained in the configuration file. To keep the interface FEFD disabled when the global configuration changes, use the `fefd reset` command.

## Related Commands

- [fefd reset](#) — enables FEFD globally on the system.
- [fefd mode](#) — changes FEFD mode on an interface.

## fefd interval

Set an interval between control packets.

### S4820T

#### Syntax

```
fefd interval seconds
```

To return to the default value, use the `no fefd interval` command.

#### Parameters

***seconds*** Enter a number as the time between FEFD control packets. The range is from 3 to 300 seconds. The default is **15 seconds**.

#### Defaults

**15 seconds**

#### Command Modes

The following is a list of the Dell Networking OS version history for this command.

| Version                  | Description                 |
|--------------------------|-----------------------------|
| 9.7(0.0)                 | Introduced on the S6000-ON. |
| 9.0.2.0                  | Introduced on the S6000.    |
| 8.3.19.0                 | Introduced on the S4820T.   |
| 8.3.11.1                 | Introduced on the Z9000.    |
| 8.3.12.0                 | Introduced on the S4810.    |
| Legacy E-Series command. |                             |

**Related  
Commands**

- [fefd](#) — enables far-end failure detection.

## fefd-global interval

Configure an interval between FEFD control packets.

### S4820T

**Syntax**

```
fefd-global interval seconds
```

To return to the default value, use the `no fefd-global interval` command.

**Parameters**

*seconds*

Enter a number as the time between FEFD control packets. The range is from 3 to 300 seconds. The default is **15 seconds**.

**Defaults**

**15 seconds**

**Command  
Modes**

CONFIGURATION

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

Legacy E-Series  
command.

**Related  
Commands**

- [fefd](#) — enables far-end failure detection.
- [fefd-global](#) — enables FEFD globally on the system.

## fefd-global

Enable FEFD globally on the system.

### S4820T

**Syntax**

```
fefd-global [interval seconds][mode {normal | aggressive}]
```

To disable FEFD globally, use the `no fefd-global [mode {normal | aggressive}]` command.

#### Parameters

|                             |                                                                                                                                                                                                                                                                                                         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interval<br/>seconds</b> | Enter the keyword <code>interval</code> followed by the number of seconds to wait between FEFD control packets. Range is from 3 to 300 seconds. Default is 15 seconds.                                                                                                                                  |
| <b>normal</b>               | (OPTIONAL) Enter the keywords <code>mode normal</code> to change the link state to "unknown" when a far-end failure the software detects on that interface. When the interface is placed in "unknown" state, the software brings down the line protocol. The default is <b>Normal mode</b> .            |
| <b>aggressive</b>           | (OPTIONAL) Enter the keywords <code>mode aggressive</code> to change the link state to "error-disabled" when a far-end failure the software detects on that interface. When an interface is placed in "error-disabled" state, t enter the <code>fefd reset</code> command to reset the interface state. |

#### Defaults

Disabled.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |

**Legacy E-Series command.**

#### Usage Information

If you enter only the `fefd-global` syntax, the mode is normal and the default interval is 15 seconds.

If you disable FEFD globally (`no fefd-global`), the system does not remove the FEFD interface configuration.

#### Related Commands

- [fefd](#) — enables far-end failure detection.
- [fefd-global interval](#) — configures an interval between FEFD control packets.

- [show fefd](#) — shows the FEFD command output.

## show fefd

View FEFD status globally or on a specific interface.

### S4820T

|                   |                                    |                                                                                                                                                                                                                                                                                                                                                                                  |

| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |

**Legacy E-Series command.**

**Usage Information** The following describes the `show fefd` command shown in the following example.

| Field            | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b> | Displays the interfaces type and number.                                                                               |
| <b>Mode</b>      | Displays the mode (aggressive or normal) or NA if the interface contains <code>fefd reset</code> in its configuration. |
| <b>Interval</b>  | Displays the interval between FEFD packets.                                                                            |

| Field | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State | <p>Displays the state of the interface and can be one of the following:</p> <ul style="list-style-type: none"> <li>• bi-directional (interface is up, connected and hearing neighbor's echoes).</li> <li>• err-disabled (only found when FEFD mode is aggressive and when the interface has not hearing its neighbor's echoes for three times the message interval. To reset an interface in this state, use the <code>fefd reset</code> command.)</li> <li>• unknown (only found when FEFD mode is normal).</li> <li>• locally disabled (interface contains the <code>fefd reset</code> command in its configuration).</li> <li>• Admin Shutdown (interface is disabled with the <code>shutdown</code> command).</li> </ul> |

### Example

```
Dell#show fefd
FEFD is globally 'ON', interval is 10 seconds, mode is
'Aggressive'.
```

| INTERFACE | MODE       | INTERVAL<br>(second) | STATE            |
|-----------|------------|----------------------|------------------|
| Te 5/1    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/2    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/3    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/4    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/5    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/6    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/7    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/8    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/9    | Aggressive | 10                   | Admin Shutdown   |
| Te 5/10   | NA         | NA                   | Locally disabled |
| Te 5/11   | Aggressive | 10                   | Err-disabled     |

```
Dell#
```

### Related Commands

- [fefd](#) — enables far-end failure detection.
- [fefd disable](#) — disables FEFD on an interface only.
- [fefd-global](#) — enables FEFD globally on the system.
- [fefd reset](#) — resets all interfaces or a single interface that was in “error-disabled” mode.

# Link Layer Discovery Protocol (LLDP)

The link layer discovery protocol (LLDP) advertises connectivity and management from the local station to the adjacent stations on an IEEE 802 LAN.

This chapter contains the following sections:

- [LLPD Commands](#)
- [LLDP-MED Commands](#)

LLDP facilitates multi-vendor interoperability by using standard management tools to discover and make available a physical topology for network management. The Dell Networking operating software implementation of LLDP is based on IEEE standard 801.1ab.

The Dell Networking OS supports the basic LLDP commands on S4820T platform.

The starting point for using LLDP is invoking LLDP with the `protocol lldp` command in either CONFIGURATION or INTERFACE mode.

The information LLDP distributes is stored by its recipients in a standard management information base (MIB). You can access the information by a network management system through a management protocol such as simple network management protocol (SNMP).

## LLPD Commands

The following are LLDP commands.

### advertise dot1-tlv

Advertise dot1 TLVs (Type, Length, Value).

#### S4820T

##### Syntax

```
advertise dot1-tlv {port-protocol-vlan-id | port-vlan-id |  
vlan-name}
```

To remove advertised dot1-tlv, use the `no advertise dot1-tlv {port-protocol-vlan-id | port-vlan-id | vlan-name}` command.

|                   |                              |                                                                                                                                        |
|-------------------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>port-protocol-vlan-id</b> | Enter the keywords <code>port-protocol-vlan-id</code> to advertise the port protocol VLAN identification TLV.                          |
|                   | <b>port-vlan-id</b>          | Enter the keywords <code>port-vlan-id</code> to advertise the port VLAN identification TLV.                                            |
|                   | <b>vlan-name</b>             | Enter the keywords <code>vlan-name</code> to advertise the vlan-name TLV. This keyword is only supported on the C-Series and S-Series. |

**Defaults** Disabled.

**Command Modes** CONFIGURATION (`conf-lldp`) and INTERFACE (`conf-if-interface-lldp`)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                          |
|----------|----------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                          |
| 9.0.2.0  | Introduced on the S6000.                                             |
| 8.3.19.0 | Introduced on the S4820T.                                            |
| 8.3.11.1 | Introduced on the Z9000.                                             |
| 8.3.7.0  | Introduced on the S4810.                                             |
| 7.7.1.0  | Introduced on the S-Series. Added the <code>vlan-name</code> option. |
| 7.6.1.0  | Introduced on the C-Series.                                          |
| 7.4.1.0  | Introduced on the E-Series.                                          |

**Related Commands**

- [protocol lldp \(Configuration\)](#) – enables LLDP globally.
- [debug lldp interface](#) – debugs LLDP.
- [show lldp neighbors](#) – displays the LLDP neighbors.

## advertise dot3-tlv

Advertise dot3 TLVs (Type, Length, Value).

### S4820T

**Syntax**

```
advertise dot3-tlv {max-frame-size}
```

To remove advertised dot3-tlv, use the `no advertise dot3-tlv {max-frame-size}` command.

|                        |                                                                                                                                                                |                                                                                          |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

## advertise management-tlv

Advertise management TLVs (Type, Length, Value).

### S4820T

|               |                                                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>advertise management-tlv {management-address   system- capabilities   system-description   system-name}</pre> <p>To remove advertised management TLVs, use the <code>no advertise management-tlv {management-address   system-capabilities   system-description   system-name}</code> command.</p> |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                            |                                                                                                                 |
|-------------------|----------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>management-address</b>  | Enter the keyword <code>management-address</code> to advertise the management IP address TLVs to the LLDP peer. |
|                   | <b>system-capabilities</b> | Enter the keywords <code>system-capabilities</code> to advertise the system capabilities TLVs to the LLDP peer. |
|                   | <b>system-description</b>  | Enter the keywords <code>system-description</code> to advertise the system description TLVs to the LLDP peer.   |
|                   | <b>system-name</b>         | Enter the keywords <code>system-name</code> to advertise the system name TLVs to the LLDP peer.                 |

| <b>Defaults</b>          | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |           |                                                   |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the Z9000 and S4810. |
| 8.3.19.0  | Introduced on the S4820T.          |

## clear lldp counters

Clear LLDP transmitting and receiving counters for all physical interfaces or a specific physical interface.

### S4820T

|                   |                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.7.1.0 | Introduced on the S-Series. |
| 7.6.1.0 | Introduced on the C-Series. |
| 7.4.1.0 | Introduced on the E-Series. |

## clear lldp neighbors

Clear LLDP neighbor information for all interfaces or a specific interface.

### S4820T

**Syntax** `clear lldp neighbors {interface}`

**Parameters**

**interface** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** none

**Command Modes** EXEC Privilege

**Command History**

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.7.1.0  | Introduced on the S-Series.                          |
| 7.6.1.0  | Introduced on the C-Series.                          |
| 7.4.1.0  | Introduced on the E-Series.                          |

## debug lldp interface

To display timer events, neighbor additions or deletions, and other information about incoming and outgoing packets, enable LLDP debugging.

### S4820T

**Syntax** `debug lldp interface {interface | all}{events | packet {brief | detail} {tx | rx | both}}`

To disable debugging, use the `no debug lldp interface {interface | all}{events} {packet {brief | detail} {tx | rx | both}}` command.

### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |
| <b>all</b>              | (OPTIONAL) Enter the keyword <code>all</code> to display information on all interfaces.                                                                                                                                                                                                                                                                            |
| <b>events</b>           | (OPTIONAL) Enter the keyword <code>events</code> to display major events such as timer events.                                                                                                                                                                                                                                                                     |
| <b>packet</b>           | (OPTIONAL) Enter the keyword <code>packet</code> to display information regarding packets coming in or going out.                                                                                                                                                                                                                                                  |
| <b>brief</b>            | (OPTIONAL) Enter the keyword <code>brief</code> to display brief packet information.                                                                                                                                                                                                                                                                               |
| <b>detail</b>           | (OPTIONAL) Enter the keyword <code>detail</code> to display detailed packet information.                                                                                                                                                                                                                                                                           |
| <b>tx</b>               | (OPTIONAL) Enter the keyword <code>tx</code> to display transmit-only packet information.                                                                                                                                                                                                                                                                          |
| <b>rx</b>               | (OPTIONAL) Enter the keyword <code>rx</code> to display receive-only packet information.                                                                                                                                                                                                                                                                           |
| <b>both</b>             | (OPTIONAL) Enter the keyword <code>both</code> to display both receive and transmit packet information.                                                                                                                                                                                                                                                            |

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.7.1.0  | Introduced on the S-Series.                          |
| 7.6.1.0  | Introduced on the C-Series.                          |
| 7.4.1.0  | Introduced on the E-Series.                          |

## disable

Enable or disable LLDP.

### S4820T

#### Syntax

`disable`

To enable LLDP, use the `no disable` command.

#### Defaults

Enabled, that is no `disable`.

#### Command Modes

CONFIGURATION (`conf-lldp`) and INTERFACE (`conf-if-interface-lldp`)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

## Related Commands

[protocol lldp \(Configuration\)](#) — enables LLDP globally.

[debug lldp interface](#) — debugs LLDP.

[show lldp neighbors](#) — displays the LLDP neighbors.

## hello

Configure the rate at which the LLDP control packets are sent to its peer.

### S4820T

#### Syntax

```
hello seconds
```

To revert to the default, use the `no hello seconds` command.

#### Parameters

**seconds**

Enter the rate, in seconds, at which the control packets are sent to its peer. The rate is from 5 to 180 seconds. The default is **30 seconds**.

#### Defaults

**30 seconds**

#### Command Modes

CONFIGURATION (conf-`lldp`) and INTERFACE (conf-if-`interface-lldp`)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

## mode

To receive or transmit, set LLDP.

### S4820T

#### Syntax

`mode {tx | rx}`

To return to the default, use the `no mode {tx | rx}` command.

#### Parameters

**tx** Enter the keyword `tx` to set the mode to transmit.

**rx** Enter the keyword `rx` to set the mode to receive.

#### Defaults

Both **transmit** and **receive**.

#### Command Modes

CONFIGURATION (conf-lldp) and INTERFACE (conf-if-*interface*-lldp)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

## protocol lldp (Configuration)

Enable the LLDP globally on the switch.

### S4820T

|                 |                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>   | <code>protocol lldp</code><br>To disable LLDP globally on the chassis, use the <code>no protocol lldp</code> command. |
| <b>Defaults</b> | Enabled.                                                                                                              |

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

## protocol lldp (Interface)

Enter the LLDP protocol in INTERFACE mode.

### S4820T

**Syntax** `[no] protocol lldp`  
To return to the global LLDP configuration mode, use the `no protocol lldp` command from Interface mode.

**Defaults** LLDP is not enabled on the interface.

**Command Modes** INTERFACE (conf-if-*interface*-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.7.1.0 | Introduced on the S-Series. |
| 7.6.1.0 | Introduced on the C-Series. |
| 7.4.1.0 | Introduced on the E-Series. |

### Usage Information

Before LLDP can be configured on an interface, it must be enabled globally from CONFIGURATION mode. This command places you in LLDP mode on the interface; it does not enable the protocol.

When you enter the LLDP protocol in the Interface context, it overrides global configurations. When you execute the `no protocol lldp` from INTERFACE mode, interfaces begin to inherit the configuration from global LLDP CONFIGURATION mode.

## show lldp neighbors

Display LLDP neighbor information for all interfaces or a specified interface.

### S4820T

#### Syntax

```
show lldp neighbors [interface] [detail]
```

#### Parameters

##### *interface*

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

##### *detail*

(OPTIONAL) Enter the keyword `detail` to display all the TLV information, remote management IP addresses, timers, and LLDP tx and rx counters.

#### Defaults

none

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version   | Description                                                                    |
|-----------|--------------------------------------------------------------------------------|
| 9.0.2.0   | Introduced on the S6000.                                                       |
| 9.1.(0.0) | Modified output of detail parameter to display remote management IP addresses. |
| 8.3.19.0  | Introduced on the S4820T.                                                      |
| 8.3.11.1  | Introduced on the Z9000.                                                       |
| 8.5.1.0   | Added support for 4-port 40G line cards on ExaScale.                           |
| 8.3.7.0   | Introduced on the S4810.                                                       |
| 7.7.1.0   | Introduced on the S-Series.                                                    |
| 7.6.1.0   | Introduced on the C-Series.                                                    |
| 7.4.1.0   | Introduced on the E-Series.                                                    |

**Usage Information** Omitting the keyword `detail` displays only the remote chassis ID, Port ID, and Dead Interval.

**Example**

```
R1(conf-if-te-1/31)#do show lldp neighbors
Loc PortID Rem Host Name Rem Port Id Rem Chassis Id
-----
Te 1/21 R2 TenGigabitEthernet 2/11 00:01:e8:06:95:3e
Te 1/31 R3 TenGigabitEthernet 3/11 00:01:e8:09:c2:4a
```

## show lldp statistics

Display the LLDP statistical information.

### S4820T

**Syntax** `show lldp statistics`

**Defaults** `none`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

| Version | Description                 |
|---------|-----------------------------|
| 7.7.1.0 | Introduced on the S-Series. |
| 7.6.1.0 | Introduced on the C-Series. |
| 7.4.1.0 | Introduced on the E-Series. |

#### Example

```
Dell#show lldp statistics
Total number of neighbors: 300
Last table change time   : Mon Oct 02 16:00:52 2006
Number of Table Inserts  : 1621
Number of Table Deletes  : 200
Number of Table Drops    : 0
Number of Table Age Outs : 400
Dell#
```

## show running-config lldp

Display the current global LLDP configuration.

### S4820T

**Syntax** show running-config lldp

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S8420T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.6.1.0  | Introduced on the C-Series. |
| 7.4.1.0  | Introduced on the E-Series. |

#### Example

```
Dell#show running-config lldp
!
protocol lldp
  advertise dot1-tlv port-protocol-vlan-id port-vlan-id
  advertise dot3-tlv max-frame-size
  advertise management-tlv system-capabilities system-
```

```
description
  hello 15
  multiplier 3
  no disable
Dell#
```

## LLDP-MED Commands

The following are the LLDP-MED (Media Endpoint Discovery) commands.

Dell Networking OS LLDP-MED commands are an extension of the set of LLDP TLV advertisement commands. The C-Series and S-Series support all commands.

The E-Series generally supports the commands. However, LLDP-MED commands are more useful on the C-Series and the S50V model of the S-Series, because they support Power over Ethernet (PoE) devices.

As defined by ANSI/TIA-1057, LLDP-MED provides organizationally specific TLVs (Type Length Value), so that endpoint devices and network connectivity devices can advertise their characteristics and configuration information. The Organizational Unique Identifier (OUI) for the Telecommunications Industry Association (TIA) is 00-12-BB.

- LLDP-MED Endpoint Device — any device that is on an IEEE 802 LAN network edge, can communicate using IP, and uses the LLDP-MED framework.
- LLDP-MED Network Connectivity Device — any device that provides access to an IEEE 802 LAN to an LLDP-MED endpoint device, and supports IEEE 802.1AB (LLDP) and TIA-1057 (LLDP-MED). The Dell Networking system is an LLDP-MED network connectivity device.

Regarding connected endpoint devices, LLDP-MED provides network connectivity devices with the ability to:

- manage inventory
- manage Power over Ethernet (POE)
- identify physical location
- identify network policy

### advertise med guest-voice

To advertise a separate limited voice service for a guest user with their own IP telephony handset or other appliances that support interactive voice services, configure the system.

#### S4820T

##### Syntax

```
advertise med guest-voice {vlan-id layer2_priority DSCP_value}
| {priority-tagged number}
```

To return to the default, use the `no advertise med guest-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

|                   |                               |                                                                                                          |
|-------------------|-------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <i>vlan-id</i>                | Enter the VLAN ID. The range is from 1 to 4094.                                                          |
|                   | <i>layer2_priority</i>        | Enter the Layer 2 priority. The range is from 0 to 7.                                                    |
|                   | <i>DSCP_value</i>             | Enter the DSCP value. The range is from 0 to 63.                                                         |
|                   | <b>priority-tagged number</b> | Enter the keywords <code>priority-tagged</code> followed the Layer 2 priority. The range is from 0 to 7. |

**Defaults** Unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.7.1.0  | Introduced on the S-Series.              |
| 7.6.1.0  | Introduced on the C-Series and E-Series. |

**Related Commands**

- [protocol lldp \(Configuration\)](#) — enables LLDP globally.
- [debug lldp interface](#) — debugs LLDP.
- [show lldp neighbors](#) — displays the LLDP neighbors.

## advertise med guest-voice-signaling

To advertise a separate limited voice service for a guest user when the guest voice control packets use a separate network policy than the voice data, configure the system.

### S4820T

**Syntax**

```
advertise med guest-voice-signaling {vlan-id layer2_priority
DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med guest-voice-signaling {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

|                   |                               |                                                                                                      |
|-------------------|-------------------------------|------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <i>vlan-id</i>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
|                   | <i>layer2_priority</i>        | Enter the Layer 2 priority. The range is from 0 to 7.                                                |
|                   | <i>DSCP_value</i>             | Enter the DSCP value. The range is from 0 to 63.                                                     |
|                   | <i>priority-tagged number</i> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

**Defaults** unconfigured.

**Command Modes** CONFIGURATION (conf-lldp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.7.1.0  | Introduced on the S-Series.              |
| 7.6.1.0  | Introduced on the C-Series and E-Series. |

**Related Commands**

- [debug lldp interface](#) — debugs LLDP.
- [show lldp neighbors](#) — displays the LLDP neighbors.

## advertise med location-identification

To advertise a location identifier, configure the system.

### S4820T

**Syntax**

```
advertise med location-identification {coordinate-based value |
civic-based value | ecs-elin value}
```

To return to the default, use the `no advertise med location-identification {coordinate-based value | civic-based value | ecs-elin value}` command.

## Parameters

|                                      |                                                                                                                                                                                                |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>coordinate-based <i>value</i></b> | Enter the keywords <code>coordinate-based</code> then the coordinated based location in hexadecimal value of 16 bytes.                                                                         |
| <b>civic-based <i>value</i></b>      | Enter the keywords <code>civic-based</code> then the civic based location in hexadecimal format. The range is from 6 to 255 bytes.                                                             |
| <b>ecs-elin <i>value</i></b>         | Enter the keywords <code>ecs-elin</code> then the Emergency Call Service (ecs) Emergency Location Identification Number (elin) numeric location string. The range is from 10 to 25 characters. |

## Defaults

unconfigured.

## Command Modes

CONFIGURATION (conf-lldp)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.7.1.0  | Introduced on the S-Series.              |
| 7.6.1.0  | Introduced on the C-Series and E-Series. |

## Usage Information

- ECS — Emergency call service such as defined by TIA or the national emergency numbering association (NENA)
- ELIN — Emergency location identification number, a valid North America Numbering Plan format telephone number supplied for ECS purposes.

## Related Commands

[debug lldp interface](#) — debugs LLDP.

[show lldp neighbors](#) — displays the LLDP neighbors.

## advertise med power-via-mdi

To advertise the Extended Power via MDI TLV, configure the system.

To advertise softphone to enable IP telephony on a computer so that the computer can be used as a phone, configure the system.

### S4820T

|               |                                                                                                            |
|---------------|------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>advertise med softphone-voice {vlan-id layer2_priority DSCP_value}   {priority-tagged number}</code> |
|---------------|------------------------------------------------------------------------------------------------------------|

To return to the default, use the `no advertise med softphone-voice {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

#### Parameters

|                                      |                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority (C-Series and E-Series only). The range is from 0 to 7.                   |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value (C-Series and E-Series only). The range is from 0 to 63.                        |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

#### Defaults

unconfigured.

## advertise med streaming-video

To advertise streaming video services for broadcast or multicast-based video, configure the system. This command does not include video applications that rely on TCP buffering.

### S4820T

#### Syntax

```
advertise med streaming-video {vlan-id layer2_priority  
DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med streaming-video {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

#### Parameters

|                                      |                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority (C-Series and E-Series only). The range is from 0 to 7.                   |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value (C-Series and E-Series only). The range is from 0 to 63.                        |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

## advertise med video-conferencing

To advertise dedicated video conferencing and other similar appliances that support real-time interactive video, configure the system.

### S4820T

#### Syntax

```
advertise med video-conferencing {vlan-id layer2_priority  
DSCP_value} | {priority-tagged number}
```

To return to the default, use the `no advertise med video-conferencing {vlan-id layer2_priority DSCP_value} | {priority-tagged number}` command.

#### Parameters

|                                      |                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>                | Enter the VLAN ID. The range is from 1 to 4094.                                                      |
| <b><i>layer2_priority</i></b>        | Enter the Layer 2 priority (C-Series and E-Series only). The range is from 0 to 7.                   |
| <b><i>DSCP_value</i></b>             | Enter the DSCP value (C-Series and E-Series only). The range is from 0 to 63.                        |
| <b><i>priority-tagged number</i></b> | Enter the keywords <code>priority-tagged</code> then the Layer 2 priority. The range is from 0 to 7. |

# Microsoft Network Load Balancing

Network Load Balancing (NLB) is a clustering functionality that is implemented by Microsoft on Windows 2000 Server and Windows Server 2003 operating systems. Microsoft NLB clustering allows multiple servers running Microsoft Windows to be represented by one MAC and one IP address to provide transparent failover and load-balancing. The Dell Networking OS does not recognize server clusters by default; you must configure NLB functionality on a switch to support server clusters. The maximum NLB entry limit from 8 to 11 is increased and support for more CAM-ACL to increase.

## arp (for Multicast MAC Address)

To associate an IP address with a multicast MAC address in the switch when you configure multicast mode of network load balancing (NLB), use address resolution protocol (ARP).

### Syntax

```
arp ip-address multicast-mac-address interface
```

To remove an ARP address, use the `no arp ip-address` command.

### Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>            | Enter an IP address in dotted decimal format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>multicast-mac-address</i> | Enter a 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format for the static MAC address to be used to switch multicast traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <i>interface</i>             | Enter any of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• The interface specified here must be one of the interfaces configured using the <code>{output-range   output} interface</code> option with the <code>mac-address-table static</code> command.</li> </ul> |

### Defaults

Not configured.

|                          |                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Command History</b>   | <b>Version 9.3(0.0)</b> Added support for association of an IP address with multicast MAC address on the S4810, S4820T, S6000, and Z9000 platforms.                                                                                                                                                                                                                           |
| <b>Usage Information</b> | For multicast mode of NLB, to associate an IP address with a multicast MAC address in the switch, use address resolution protocol (ARP) by entering the <code>arp ip-address multicast-mac-address</code> command in Global configuration mode. This setting causes the multicast MAC address to be mapped to the cluster IP address for NLB mode of operation of the switch. |
| <b>Related Commands</b>  | <a href="#">clear arp-cache</a> — clears dynamic ARP entries from the ARP table.<br><a href="#">show arp</a> — displays the ARP table.                                                                                                                                                                                                                                        |

## mac-address-table static (for Multicast MAC Address)

For multicast mode of network load balancing (NLB), configure a static multicast MAC address, associate the multicast MAC address with the VLAN used to switch Layer 2 multicast traffic, and add output ports that will receive multicast streams on the VLAN. To delete a configured static multicast MAC address from the MAC address table on the router, enter the `no mac-address-table static multicast-mac-address` command.

**Syntax**

```
mac-address-table static multicast-mac-address multicast vlan
vlan-id range-output {single-interface | interface-list |
interface-range}
```

To remove a MAC address, use the `no mac-address-table static multicast-mac-address output interface vlan vlan-id` command.

### Parameters

***multicast-mac-address*** Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.

***multicast*** Enter a vlan port to where L2 multicast MAC traffic is forwarded.

**NOTE:** Use this option if you want multicast functionality in an L2 VLAN without IGMP protocols.

***output interface*** For a multicast MAC address, enter the keyword `output` then one of the following interfaces for which traffic is forwarded:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**output-range  
interface**

For a multicast MAC address, enter the keyword `output-range` then one of the following interfaces to indicate a range of ports for which traffic is forwarded:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**vlan *vlan-id***

Enter the keyword `vlan` then a VLAN ID number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                  |
|----------|--------------------------------------------------------------|
| 9.3(0.0) | Added support for multicast MAC address on the MXL platform. |

**Example (Multicast)** `mac-address-table static 01:00:5E:01:00:01 {multicast vlan 2 output-range Te 1/2,Te 1/3}`

## ip vlan-flooding

Enable unicast data traffic flooding on VLAN member ports.

**Syntax** `ip vlan-flooding`  
To disable, use the `no ip vlan-flooding` command.

**Command Modes** CONFIGURATION

**Command History** **Version 9.3(0.0)** Introduced on the S4810, S4820T, S6000, Z9000, and MXL platforms

| <b>Version</b>  | <b>Description</b>                                                |
|-----------------|-------------------------------------------------------------------|
| <b>9.3(0.0)</b> | Introduced on the S4810, S4820T, S6000, Z9000, and MXL platforms. |

**Default** Disabled

**Usage Information** By default this command is disabled. There might be some ARP table entries which are resolved through ARP packets which had Ethernet MAC SA different from MAC information inside the ARP packet. This unicast data traffic flooding occurs only for those packets which use these ARP entries.

# Multicast Source Discovery Protocol (MSDP)

Multicast source discovery protocol (MSDP) connects multiple PIM Sparse-Mode (PIM-SM) domains together.

MSDP peers connect using TCP port 639. Peers send keepalives every 60 seconds. A peer connection is reset after 75 seconds if no MSDP packets are received. MSDP connections are parallel with MBGP connections.

The Dell Networking operating system supports MSDP commands on the S4820T platform.

## clear ip msdp peer

Reset the TCP connection to the peer and clear all the peer statistics.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip msdp peer {peer address}</code>                                                                                                                 |
| <b>Parameters</b>      | <b>peer address</b> Enter the peer address in a dotted decimal format (A.B.C.D.)                                                                               |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |

| Version | Description              |
|---------|--------------------------|
| 8.3.7.1 | Introduced on the S4810. |
| 6.2.1.1 | Introduced               |

## clear ip msdp sa-cache

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

### S4820T

**Syntax** `clear ip msdp sa-cache [group-address | rejected-sa | local]`

#### Parameters

|                      |                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>group-address</b> | Enter the group IP address in dotted decimal format (A.B.C.D.).                                                                                                                                                                             |
| <b>rejected-sa</b>   | Enter the keywords <code>rejected-sa</code> to clear the cache source-active entries that are rejected because the RPF check failed, an SA filter or limit is configured, the RP or MSDP peer is unreachable, or because of a format error. |
| <b>local</b>         | Enter the keyword <code>local</code> to clear out local PIM advertised entries. It applies the redistribute filter (if present) while adding the local PIM SA entries to the SA cache.                                                      |

**Defaults** Without any options, this command clears the entire source-active cache.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.1  | Introduced on the S4810.             |
| 7.8.1.0  | Added the <code>local</code> option. |

| Version | Description                                |
|---------|--------------------------------------------|
| 7.7.1.0 | Added the <code>rejected-sa</code> option. |
| 6.2.1.1 | Introduced                                 |

## clear ip msdp statistic

Clears the entire source-active cache, the source-active entries of a particular multicast group, rejected, or local source-active entries.

### S4820T

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip msdp statistic peer peer-address</code>                                                                                                                                                                                                          |
| <b>Parameters</b>      | <p><b>peer</b> Enter the keyword <code>peer</code> to clear the MSDP peer entries.</p> <p><b>peer-address</b> Enter the IP address of the MSDP peer.</p>                                                                                                        |
| <b>Defaults</b>        | Without any options, this command clears the entire source-active cache.                                                                                                                                                                                        |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                                                                                                                  |

# debug ip msdp

Turn on MSDP debugging.

## S4820T

**Syntax** `debug ip msdp {event peer address | packet peer address | pim}`  
To turn debugging off, use the `no debug ip msdp {event peer address | packet peer address | pim}` command.

**Parameters**

|                            |                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------|
| <b>event peer address</b>  | Enter the keyword <code>event</code> then the peer address in a dotted decimal format (A.B.C.D.).  |
| <b>packet peer address</b> | Enter the keyword <code>packet</code> then the peer address in a dotted decimal format (A.B.C.D.). |
| <b>pim</b>                 | Enter the keyword <code>pim</code> to debug advertisement from PIM.                                |

**Defaults** Not configured.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 6.2.1.1  | Introduced                  |

# ip msdp cache-rejected-sa

Enable an MSDP cache for the rejected source-active entries.

## S4820T

### Syntax

```
ip msdp cache-rejected-sa {number}
```

To clear the MSDP rejected source-active entries, use the `no ip msdp cache-rejected-sa {number}` command then the `ip msdp cache-rejected-sa {number}` command.

### Parameters

**number**

Enter the number of rejected SA entries to cache. The range is from 0 to 32766.

### Defaults

none

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.4.1.0  | Introduced                  |

### Related Commands

[show ip msdp sa-cache rejected-sa](#) — displays the rejected SAs in the SA cache.

# ip msdp default-peer

Define a default peer from which to accept all source-active (SA) messages.

## S4820T

### Syntax

```
ip msdp default-peer peer address [list name]
```

To remove the default peer, use the `no ip msdp default-peer {peer address} list name` command.

### Parameters

|                            |                                                                                                                                                                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>peer address</i></b> | Enter the peer address in a dotted decimal format (A.B.C.D.)                                                                                                                                                                   |
| <b><i>list name</i></b>    | Enter the keywords <code>list name</code> and specify a standard access list that contains the RP address that should be treated as the default peer. If no access list is specified, then all SAs from the peer are accepted. |

### Defaults

Not configured.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                         |
|----------|-------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                         |
| 9.0.2.0  | Introduced on the S6000.                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                            |
| 7.8.1.0  | Added the <code>list</code> option and removed the <code>prefix-list</code> option. |
| 7.4.1.0  | Introduced                                                                          |

### Usage Information

If a list is not specified, all SA messages received from the default peer are accepted. You can enter multiple `default peer` commands.

## ip msdp log-adjacency-changes

Enable logging of MSDP adjacency changes.

### S4820T

**Syntax** `ip msdp log-adjacency-changes`  
To disable logging, use the `no ip msdp log-adjacency-changes` command.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

## ip msdp mesh-group

To be a member of a mesh group, configure a peer.

### S4820T

**Syntax** `ip msdp mesh-group {name} {peer address}`  
To remove the peer from a mesh group, use the `no ip msdp mesh-group {name} {peer address}` command.

**Parameters**

|                    |                                                                        |
|--------------------|------------------------------------------------------------------------|
| <b><i>name</i></b> | Enter a string of up to 16 characters long for as the mesh group name. |
|--------------------|------------------------------------------------------------------------|

|                        |                                                                                                                                                                |                                                               |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
|                        | <b>peer address</b>                                                                                                                                            | Enter the peer address in a dotted decimal format (A.B.C.D.). |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |                                                               |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                               |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 6.2.1.1  | Introduced                  |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | An MSDP mesh group is a mechanism for reducing SA flooding, typically in an intra-domain setting. When some subset of a domain's MSDP speakers are fully meshed, they can be configured into a mesh-group. If member X of a mesh-group receives a SA message from an MSDP peer that is also a member of the mesh-group, member X accepts the SA message and forwards it to all of its peers that are not part of the mesh-group. However, member X cannot forward the SA message to other members of the mesh-group. |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ip msdp originator-id

Configure the MSDP Originator ID.

### S4820T

|               |                                                                                                                                                   |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>ip msdp originator-id {interface}</code><br>To remove the originator-id, use the <code>no ip msdp originator-id {interface}</code> command. |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                  |                                                                                                                                                                                                                                            |
|-------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>interface</b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> </ul> |
|-------------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.5(0.1) | Introduced on the Z9500.                             |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 6.2.1.1  | Introduced                                           |

## ip msdp peer

Configure an MSDP peer.

### S4820T

**Syntax**

```
ip msdp peer peer address [connect-source] [description] [sa-limit number]
```

To remove the MSDP peer, use the `no ip msdp peer peer address [connect-source interface] [description name] [sa-limit number]` command.

## Parameters

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>peer address</i></b>             | Enter the peer address in a dotted decimal format (A.B.C.D.).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>connect-source interface</i></b> | Enter the keywords <code>connect-source</code> then one of the interfaces and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b><i>description name</i></b>         | (OPTIONAL) Enter the keyword <code>description</code> then a description name (maximum 80 characters) to designate a description for the MSDP peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>sa-limit number</i></b>          | (OPTIONAL) Enter the maximum number of SA entries in SA-cache. The range is from 1 to 100000. .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Defaults

As described in the *Parameters* section.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>                                                       |
|-----------------|--------------------------------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                              |
| <b>9.5(0.1)</b> | Introduced on the Z9500.                                                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                 |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                 |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                 |
| <b>8.5.1.0</b>  | Added support for 4-port 40G line cards on ExaScale.                     |
| <b>7.5.1.0</b>  | Added option for SA upper limit and the <code>description</code> option. |
| <b>6.2.1.1</b>  | Introduced                                                               |

## Usage Information

The `connect-source` option is used to supply a source IP address for the TCP connection. When an interface is specified using the `connect-source` option, the primary configured address on the interface is used.

If the total number of SA messages received from the peer is already larger than the limit when this command is applied, those SA messages continue to be accepted. To enforce the limit in such situation, use the `clear ip msdp peer` command to reset the peer.

## Related Commands

[ip msdp sa-limit](#) — configures the MSDP SA Limit.

[clear ip msdp peer](#) — clears the MSDP peer.

[show ip msdp](#) — displays the MSDP information.

# ip msdp redistribute

Filter local PIM SA entries in the SA cache. SAs which the ACL denies time out and are not refreshed. Until they time out, they continue to reside in the MSDP SA cache.

## S4820T

### Syntax

```
ip msdp redistribute [list acl-name]
```

### Parameters

**list *acl-name*** Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked.

### Defaults

Not configured.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version | Description              |
|---------|--------------------------|
| 8.3.7.0 | Introduced on the S4810. |
| 7.8.1.0 | Introduced               |

#### Usage Information

Modifications to the ACL do not have an immediate effect on the sa-cache.

To apply the redistribute filter to entries already present in the SA cache, use the `clear ip msdp sa-cache local` command.

## ip msdp sa-filter

Permit or deny MSDP source active (SA) messages based on multicast source and/or group from the specified peer.

### S4820T

#### Syntax

```
ip msdp sa-filter {in | out} peer-address list [access-list name]
```

Remove this configuration using the `no ip msdp sa-filter {in | out} peer address list [access-list name]` command.

#### Parameters

|                         |                                                                                                                              |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>in</b>               | Enter the keyword <code>in</code> to enable incoming SA filtering.                                                           |
| <b>out</b>              | Enter the keyword <code>out</code> to enable outgoing SA filtering.                                                          |
| <b>peer-address</b>     | Enter the peer address of the MSDP peer in a dotted decimal format (A.B.C.D.).                                               |
| <b>access-list name</b> | Enter the name of an extended ACL that contains permitted SAs. If you do not use this option, all local entries are blocked. |

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the E-Series. |

## ip msdp sa-limit

Configure the upper limit of source-active (SA) entries in SA-cache.

### S4820T

**Syntax** `ip msdp sa-limit number`  
 To return to the default, use the `no ip msdp sa-limit number` command.

**Parameters** *number* Enter the maximum number of SA entries in SA-cache. The range is from 1 to 500000.

**Defaults** **50000**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.5.1.0  | Introduced on the E-Series. |

**Usage Information** Dell Networking OS counts the SA messages originated by itself and those messages received from the MSDP peers. When the total SA messages reach this

limit, the subsequent SA messages are dropped (even if they pass RPF checking and policy checking).

If the total number of SA messages is already larger than the limit when this command is applied, those SA messages that are already in Dell Networking OS continue to be accepted. To enforce the limit in such situation, use the `clear ip msdp sa-cache` command.

#### Related Commands

[ip msdp peer](#) — configures the MSDP peer.

[clear ip msdp peer](#) — clears the MSDP peer.

[show ip msdp](#) — displays the MSDP information.

## ip msdp shutdown

Administratively shut down a configured MSDP peer.

### S4820T

**Syntax** `ip msdp shutdown {peer address}`

**Parameters** **peer address** Enter the peer address in a dotted decimal format (A.B.C.D.).

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 6.2.1.1  | Introduced                  |

## ip multicast-msdp

Enable MSDP.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip multicast-msdp</code><br>To exit MSDP, use the <code>no ip multicast-msdp</code> command.                                                             |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |

# Multiple Spanning Tree Protocol (MSTP)

Multiple spanning tree protocol (MSTP), as implemented by the Dell Networking operating system, conforms to IEEE 802.1s.

This command supports the Dell Networking S4820T platform.

## debug spanning-tree mstp

Enable debugging of the multiple spanning tree protocol and view information on the protocol.

### S4820T

|                   |                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                   | <b>bpdu</b>                                                                                                                                          | <p>(OPTIONAL) Enter the keyword <code>bpdu</code> to debug bridge protocol data units (BPDU).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                   | <b>interface {in   out}</b>                                                                                                                          | <p>(OPTIONAL) Enter the interface keyword along with the type slot/port of the interface you want displayed. Type slot/port options are the following:</p> <ul style="list-style-type: none"> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> <p>Optionally, enter an <code>in</code> or <code>out</code> parameter with the optional interface:</p> <ul style="list-style-type: none"> <li>• For Receive, enter the keyword <code>in</code>.</li> <li>• For Transmit, enter the keyword <code>out</code>.</li> </ul> |

**events** (OPTIONAL) Enter the keyword `events` to debug MSTP events.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                          |
| 9.2(1.0)    | Introduced on the Z9500.                             |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

**Example**

```
Dell#debug spanning-tree mstp bpdu tengigabitethernet 2/1 ?
in Receive (in)
out Transmit (out)
```

## disable

Globally disable the multiple spanning tree protocol on the switch.

### S4820T

**Syntax** `disable`  
To enable MSTP, enter the `no disable` command.

**Defaults** disabled.

**Command Modes** MULTIPLE SPANNING TREE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

## Related Commands

[protocol spanning-tree mstp](#) — enters MULTIPLE SPANNING TREE mode.

# forward-delay

The amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

## S4820T

### Syntax

```
forward-delay seconds
```

To return to the default setting, use the `no forward-delay` command.

### Parameters

***seconds*** Enter the number of seconds the interface waits in the Blocking State and the Learning State before transiting to the Forwarding State. The range is from 4 to 30. The default is **15 seconds**.

### Defaults

**15 seconds**

### Command Modes

MULTIPLE SPANNING TREE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

#### Related Commands

[max-age](#) — changes the wait time before MSTP refreshes protocol configuration information.

[hello-time](#) — changes the time interval between bridge protocol data units (BPDUs).

## hello-time

Set the time interval between generation of MSTB bridge protocol data units (BPDUs).

### S4820T

#### Syntax

```
hello-time seconds
```

To return to the default value, use the `no hello-time` command.

#### Parameters

**seconds**

Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is **2 seconds**.

#### Defaults

**2 seconds**

#### Command Modes

MULTIPLE SPANNING TREE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

#### Related Commands

[forward-delay](#) — the amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

[max-age](#) — changes the wait time before MSTP refreshes protocol configuration information.

## max-age

To maintain configuration information before refreshing that information, set the time interval for the MSTB.

### S4820T

#### Syntax

`max-age seconds`

To return to the default values, use the `no max-age` command.

#### Parameters

***max-age*** Enter a number of seconds the Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is **20 seconds**.

#### Defaults

**20 seconds**

#### Command Modes

MULTIPLE SPANNING TREE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

#### Related Commands

[forward-delay](#) — the amount of time the interface waits in the Blocking State and the Learning State before transitioning to the Forwarding State.

[hello-time](#) — changes the time interval between BPDUs.

## max-hops

Configure the maximum hop count.

### S4820T

#### Syntax

`max-hops number`

To return to the default values, use the `no max-hops` command.

#### Parameters

##### range

Enter a number for the maximum hop count. The range is from 1 to 40. The default is **20**.

#### Defaults

**20 hops**

#### Command Modes

MULTIPLE SPANNING TREE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.1  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

#### Usage Information

The `max-hops` command is a configuration command that applies to both the IST and all MST instances in the MSTP region. The BPDUs sent out by the root switch set the remaining-hops parameter to the configured value of max-hops. When a switch receives the BPDU, it decrements the received value of the remaining hops and uses the resulting value as remaining-hops in the BPDUs. If the remaining-hops reach zero, the switch discards the BPDU and ages out any information that it holds for the port.

## msti

Configure multiple spanning tree instance, bridge priority, and one or multiple VLANs mapped to the MST instance.

### S4820T

#### Syntax

```
msti instance {vlan range | bridge-priority priority}
```

To disable mapping or bridge priority, use the `no msti instance {vlan range | bridge-priority priority}` command.

#### Parameters

|                                 |                                                                                                                                                                                                                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>msti instance</b>            | Enter the MSTP instance. The range is from zero (0) to 63.                                                                                                                                                                                                                                                                 |
| <b>vlan range</b>               | Enter the keyword <code>vlan</code> then the identifier range value. The range is from 1 to 4094.                                                                                                                                                                                                                          |
| <b>bridge-priority priority</b> | Enter the keywords <code>bridge-priority</code> then a value in increments of 4096 as the bridge priority. The range is from zero (0) to 61440.<br>Valid priority values are: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected. |

#### Defaults

default bridge-priority is **32768**.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

**Usage Information** By default, all VLANs are mapped to MST instance zero (0) unless you use the `vlan range` command to map it to a non-zero instance.

## name

The name you assign to the multiple spanning tree region.

### S4820T

**Syntax** `name region-name`  
To remove the region name, use the `no name` command.

**Parameters** ***region-name*** Enter the MST region name. The range is 32 character limit.

**Defaults** no default name.

**Command Modes** MULTIPLE SPANNING TREE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

**Usage Information**

For two MSTP switches to be within the same MSTP region, the switches must share the same region name (including matching case).

**Related Commands**

[msti](#) — maps the VLAN(s) to an MST instance.

[revision](#) — assigns the revision number to the MST configuration.

## protocol spanning-tree mstp

To enable and configure the multiple spanning tree group, enter MULTIPLE SPANNING TREE mode.

### S4820T

**Syntax**

`protocol spanning-tree mstp`

To disable the multiple spanning tree group, use the `no protocol spanning-tree mstp` command.

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

MSTP is not enabled when you enter MULTIPLE SPANNING TREE mode. To enable MSTP globally on the switch, enter the `no disable` command while in MULTIPLE SPANNING TREE mode.

For more information about the multiple spanning tree protocol, refer to the *Dell Networking OS Configuration Guide*.

#### Example

```
Dell(conf)#protocol spanning-tree mstp
Dell(config-mstp)#no disable
```

#### Related Commands

[disable](#) — disables multiple spanning tree.

## revision

The revision number for the multiple spanning tree configuration.

### S4820T

#### Syntax

`revision range`

To return to the default values, use the `no revision` command.

#### Parameters

**range**

Enter the revision number for the MST configuration. The range is from 0 to 65535. The default is **0**.

#### Defaults

**0**

#### Command Modes

MULTIPLE SPANNING TREE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

For two MSTP switches to be within the same MST region, the switches must share the same revision number.

**Related Commands**

[msti](#) – maps the VLAN(s) to an MST instance.

[name](#) – assigns the region name to the MST region.

## show config

View the current configuration for the mode. Only non-default values are shown.

### S4820T

**Syntax** `show config`

**Command Modes** MULTIPLE SPANNING TREE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |
| 6.5.1.0 | Introduced on the E-Series. |

#### Example

```
Dell(conf-mstp)#show config
!
protocol spanning-tree mstp
  no disable
  name CustomerSvc
  revision 2
  MSTI 10 VLAN 101-105
  max-hops 5
Dell(conf-mstp)#
```

## show spanning-tree mst configuration

View the multiple spanning tree configuration.

### S4820T

**Syntax** `show spanning-tree mst configuration`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

Enable the multiple spanning tree protocol prior to using this command.

**Example**

```
Dell#show spanning-tree mst configuration
MST region name: CustomerSvc
Revision: 2
MSTI VID
  10 101-105
Dell#
```

## show spanning-tree msti

View the multiple spanning tree instance.

### S4820T

**Syntax**

```
show spanning-tree msti [instance-number [brief]] [guard]
```

**Parameters**

- |                               |                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>instance-number</i></b> | (Optional) Enter the multiple spanning tree instance number. The range is from 0 to 63.                                               |
| <b>brief</b>                  | (Optional) Enter the keyword <code>brief</code> to view a synopsis of the MST instance.                                               |
| <b>guard</b>                  | (Optional) Enter the keyword <code>guard</code> to display the type of guard enabled on an MSTP interface and the current port state. |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                      |
|----------|------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                      |
| 9.0.2.0  | Introduced on the S6000.                                                                                         |
| 8.3.19.0 | Introduced on the S4820T.                                                                                        |
| 8.3.11.1 | Introduced on the Z9000.                                                                                         |
| 8.4.2.1  | Support for the optional keyword <code>guard</code> was added on the C-Series, S-Series, and E-Series TeraScale. |

| Version | Description                                                                                |
|---------|--------------------------------------------------------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                                                                   |
| 7.6.1.0 | Introduced on the S-Series.                                                                |
| 7.5.1.0 | Introduced on the C-Series.                                                                |
| 6.4.1.0 | Expanded to display the port error disable state (EDS) loopback BPDU inconsistency causes. |

#### Usage Information

Enable the multiple spanning tree protocol prior to using this command.

#### Example

```
Dell#show spanning-tree msti 10
MSTI 10 VLANs mapped 101-105

Bridge Identifier has priority 32768, Address 0001.e802.3506
Configured hello time 2, max age 20, forward delay 15, max
hops 5
Current root has priority 16384, Address 0001.e800.0a5c
Number of topology changes 0, last change occurred 3058087

Port 82 (TenGigabitEthernet 2/1) is designated Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.82
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 32768, address 0001.e802.35:06
Designated port id is 128.82, designated path cost
Number of transitions to forwarding state 1
BPDU (Mrecords): sent 1109, received 0
The port is not in the portfast mode

Port 88 (TenGigabitEthernet 2/6) is root Forwarding
Port path cost 0, Port priority 128, Port Identifier 128.88
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.88, designated path cost
Number of transitions to forwarding state 4
BPDU (Mrecords): sent 19, received 1103
The port is not in the portfast mode

Port 89 (TenGigabitEthernet 2/7) is alternate Discarding
Port path cost 0, Port priority 128, Port Identifier 128.89
Designated root has priority 16384, address 0001.e800.0a:5c
Designated bridge has priority 16384, address 0001.e800.0a:5c
Designated port id is 128.89, designated path cost
Number of transitions to forwarding state 3
BPDU (Mrecords): sent 7, received 1103
The port is not in the portfast mode
```

#### Example (EDS and LBK)

The bold line shows the loopback BPDU inconsistency (LBK\_INC).

```
Dell#show spanning-tree msti 0 brief
MSTI 0 VLANs mapped 1-4094

Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32768, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15, max
hops 20
Bridge ID Priority 32768, Address 0001.e801.6aa8
We are the root of MSTI 0 (CIST)
Configured hello time 2, max age 20, forward delay 15, max
```

```

hops 20
CIST regional root ID Priority 32768, Address 0001.e801.6aa8
CIST external path cost 0

Number of transitions to forwarding state 1
BPDU (MRecords): sent 21, received 9
The port is not in the Edge port mode

```

**Usage Information**

The following describes the show spanning-tree msti 5 guard command shown in the following example.

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | MSTP interface.                                                                                                         |
| <b>Instance</b>       | MSTP instance.                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

**Example (Guard)**

```

Dell#show spanning-tree msti 5 guard
Interface
Name      Instance  Sts Guard      type
-----
Te 1/1   5          INCON(Root)  Rootguard

```

|        |   |            |           |
|--------|---|------------|-----------|
| Te 1/2 | 5 | FWD        | Loopguard |
| Te 1/3 | 5 | EDS (Shut) | Bpduguard |

## spanning-tree

Enable the multiple spanning tree protocol on the interface.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>spanning-tree</code><br>To disable the multiple spanning tree protocol on the interface, use the <code>no spanning-tree</code> command.                  |
| <b>Parameters</b>      | <b>spanning-tree</b> Enter the keywords <code>spanning-tree</code> to enable the MSTP on the interface.                                                        |
| <b>Defaults</b>        | Enable.                                                                                                                                                        |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.0 | Introduced on the E-Series. |

# spanning-tree msti

Configure multiple spanning tree instance cost and priority for an interface.

## S4820T

|                   |                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>spanning-tree msti <i>instance</i> {cost <i>cost</i>   priority <i>priority</i>}</code> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b> | <b><i>msti instance</i></b>                                                                   | Enter the keyword <code>msti</code> and the MST instance number. The range is from zero (0) to 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                   | <b><i>cost cost</i></b>                                                                       | (OPTIONAL) Enter the keyword <code>cost</code> then the port cost value. The range is from 1 to 200000. The defaults are: <ul style="list-style-type: none"><li>• 100 Mb/s Ethernet interface = <b>200000</b></li><li>• 1-Gigabit Ethernet interface = <b>20000</b></li><li>• 10-Gigabit Ethernet interface = <b>2000</b></li><li>• Port Channel interface with one 100 Mb/s Ethernet = <b>200000</b></li><li>• Port Channel interface with one 1 Gigabit Ethernet = <b>20000</b></li><li>• Port Channel interface with one 10 Gigabit Ethernet = <b>2000</b></li><li>• Port Channel with two 1 Gigabit Ethernet = <b>18000</b></li><li>• Port Channel with two 10 Gigabit Ethernet = <b>1800</b></li><li>• Port Channel with two 100 Mbps Ethernet = <b>180000</b></li></ul> |
|                   | <b><i>priority priority</i></b>                                                               | Enter keyword <code>priority</code> then a value in increments of 16 as the priority. The range is from 0 to 240. The default is <b>128</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                 |                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b> | <ul style="list-style-type: none"><li>• cost = depends on the interface type</li><li>• priority = <b>128</b></li></ul> |
|-----------------|------------------------------------------------------------------------------------------------------------------------|

|                      |           |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced on the E-Series. |

## spanning-tree mstp edge-port

Configures the interface as an MST edge port and optionally a Bridge Protocol Data Unit (BPDU) guard.

### S4820T

**Syntax** `spanning-tree mstp edge-port [bpduguard [shutdown-on-violation]]`

#### Parameters

|                              |                                                                                                                                                                                                                                          |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mstp edge-port</b>        | Enter the keyword <code>mstp</code> then the keywords <code>edge-port</code> to configure the interface as a Multiple Spanning Tree edge port.                                                                                           |
| <b>bpduguard</b>             | (OPTIONAL) Enter the keyword <code>portfast</code> to enable Portfast to move the interface into forwarding mode immediately after the root fails. Enter the keyword <code>bpduguard</code> to disable the port when it receives a BPDU. |
| <b>shutdown-on-violation</b> | (OPTIONAL) Enter the keywords <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                                      |

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version | Description                                                        |
|---------|--------------------------------------------------------------------|
| 8.3.7.1 | Introduced on the S4810.                                           |
| 8.2.1.0 | Introduced the hardware <code>shutdown-on-violation</code> option. |
| 7.6.1.0 | Introduced on the S-Series.                                        |
| 7.5.1.0 | Introduced on the C-Series.                                        |
| 6.5.1.0 | Introduced on the E-Series.                                        |

**Usage Information**

On an MSTP switch, a port configured as an edge port immediately transitions to the Forwarding state. Only configure ports connected to end-hosts as edge ports. Consider an edge port similar to a port with spanning-tree portfast enabled. If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

## tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

### S4820T

**Syntax**

`tc-flush-standard`  
To disable, use the `no tc-flush-standard` command.

**Defaults**

Disabled.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |
| 6.5.1.0 | Introduced                  |

**Usage  
Information**

By default, Dell Networking OS implements an optimized flush mechanism for MSTP. This mechanism helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, this `knob` command can be turned on to enable flushing MAC addresses after receiving every topology change notification.

# Multicast

The multicast commands are supported by Dell Networking operating system (OS) on all S4820T platform.

This chapter contains the following sections:

- [IPv4 Multicast Commands](#)

## IPv4 Multicast Commands

The following section contains the IPv4 multicast commands.

### clear ip mroute

Clear learned multicast routes on the multicast forwarding table. To clear the protocol-independent multicast (PIM) tree information base, use the `clear ip pim tib` command.

#### S4820T

**Syntax** `clear ip mroute [vrf vrf-name] {group-address [source-address] | * | snooping}`

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group-address [source-address]** Enter the multicast group address and source address (if desired), in dotted decimal format, to clear information on a specific group.

**\*** Enter \* to clear all multicast routes.

**snooping** Enter the keyword `snooping` to delete multicast snooping route table entries.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                      |
|-----------|----------------------------------------------------------------------------------|
| 9.7(0.0)  | Added support for VRF. Introduced on the S6000-ON.                               |
| 9.2(1.0)  | Introduced on the Z9500.                                                         |
| 9.2.(0.0) | Added support for keyword <code>snooping</code> on the Z9000, S4810, and S4820T. |
| 9.0.2.0   | Introduced on the S6000.                                                         |
| 8.3.19.0  | Introduced on the S4820T.                                                        |
| 8.3.7.0   | Introduced on the S4810.                                                         |
| 7.8.1.0   | Introduced on the C-Series.                                                      |

E-Series legacy command

## Related Commands

[show ip pim tib](#) — shows the PIM tree information base.

## ip mroute

Assign a static mroute.

### S4820T

#### Syntax

```
ip mroute [vrf vrf-name] destination mask {ip-address | null 0}
{{bgp| ospf} process-id | isis | rip | static} {ip-address |
tag | null 0}} [distance]
```

To delete a specific static mroute, use the `no ip mroute [vrf vrf-name] destination mask {ip-address | null 0} {{bgp| ospf} process-id | isis | rip | static} {ip-address | tag | null 0}} [distance]` command.

To delete all mroutes matching a certain mroute, use the `no ip mroute [vrf vrf-name] destination mask` command.

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to assign a static mroute to that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**destination** Enter the IP address in dotted decimal format of the destination device.

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(1.0) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.7.0  | Introduced on the S4810.                           |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(1.0) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.7.0  | Introduced on the S4810.                           |
| 7.8.1.0  | Introduced on the C-Series.                        |
| 7.6.1.0  | Introduced on the E-Series.                        |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>This feature allows you to limit the number of multicast entries on the system. This number is the total of all the multicast entries on all line cards in the system. On each line card, the multicast module only installs the maximum number of entries, depending on the configured CAM profile.</p> <p>To store multicast routes, use the IN-L3-McastFib CAM partition. It is a separate hardware limit that exists per port-pipe. This hardware space limitation can supersede any software-configured limit. The opposite is also true, the CAM partition might not be exhausted at the time the system-wide route limit set by the <code>ip multicast-limit</code> command is reached.</p> |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                         |                                                              |

## ip multicast-routing

Enable IP multicast forwarding.

### S4820T

| <b>Syntax</b>            | <code>ip multicast-routing [vrf <i>vrf-name</i>]</code><br>To disable multicast forwarding, use the <code>no ip multicast-routing [vrf <i>vrf-name</i>]</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |          |                                                    |          |                          |         |                          |          |                           |          |                          |         |                          |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|----------------------------------------------------|----------|--------------------------|---------|--------------------------|----------|---------------------------|----------|--------------------------|---------|--------------------------|
| <b>Defaults</b>          | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                                                    |          |                          |         |                          |          |                           |          |                          |         |                          |
| <b>Parameters</b>        | <b><i>vrf vrf-name</i></b> (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to enable IP multicast forwarding on that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |          |                                                    |          |                          |         |                          |          |                           |          |                          |         |                          |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |          |                                                    |          |                          |         |                          |          |                           |          |                          |         |                          |

| <b>Usage Information</b> | After you enable multicast, you can enable IGMP and PIM on an interface. In INTERFACE mode, enter the <code>ip pim sparse-mode</code> command to enable IGMP and PIM on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                                                    |          |                          |         |                          |          |                           |          |                          |         |                          |
| <b>Related Commands</b>  | <a href="#">ip pim sparse-mode</a> — enables IGMP and PIM on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                                                    |          |                          |         |                          |          |                           |          |                          |         |                          |

## show ip mroute

View the multicast routing table.

**Syntax** `show ip mroute [vrf vrf-name] [static | group-address [source-address] | count | snooping [vlan vlan-idIntroduced on the S6000-ON.] [group-address [source-address]] | summary | vlt [group-address [source-address] | count]`

### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**static** (OPTIONAL) Enter the keyword `static` to view static multicast routes.

**group-address [source-address]** (OPTIONAL) Enter the multicast group-address to view only routes associated with that group. Enter the source-address to view routes with that group-address and source-address.

**count** (OPTIONAL) Enter the keyword `count` to view the number of multicast routes and packets.

**snooping [vlan vlan-id]** Enter the keyword `snooping` to display information on the multicast routes PIM-SM snooping discovers.

**[group-address [source-address]]** Enter a VLAN ID to limit the information displayed to the multicast routes PIM-SM snooping discovers on a specified VLAN. The VLAN ID range is from 1 to 4094.

Enter a multicast group address and, optionally, a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes PIM-SM snooping discovers for a specified multicast group and source.

**summary** (OPTIONAL) Enter the keyword `summary` to view a summary of all routes.

**vlt** (OPTIONAL) Enter the keyword `vlt` to view multicast routes with a spanned incoming interface. Enter a multicast group address in dotted decimal format (A.B.C.D) to limit the information displayed to the multicast routes for a specified multicast group and optionally a source multicast address in dotted decimal format (A.B.C.D) to limit the information displayed for a specified multicast source. Enter the keyword `count` to display the total number of multicast routes with the spanned IIF.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0)                       | Added support for VRF. Introduced on the S6000-ON.                                                                                                                                                  |
| 9.2(1.0)                       | Introduced on the Z9500.                                                                                                                                                                            |
| 9.0.2.0                        | Introduced on the S6000.                                                                                                                                                                            |
| 9.2.(0.0)                      | Added support for keyword <code>vlt</code> to the Z9000, S4810, and S4820T.                                                                                                                         |
| 8.4.1.1                        | Support for the keyword <code>snooping</code> and the optional <code>vlan vlan-id</code> , <code>group-address</code> , and <code>source-address</code> parameters were added on E-Series ExaScale. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                                                                                                                           |
| 8.3.7.0                        | Introduced on the S4810.                                                                                                                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                                                                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                                                                                                                         |
| <b>E-Series legacy command</b> |                                                                                                                                                                                                     |

**Example (Static)**

```
Dell#show ip mroute static
Mroute: 23.23.23.0/24, interface: Lo 2
Protocol: static, distance: 0, route-map: none, last change:
00:00:23
```

**Example (Snooping)**

```
Dell#show ip mroute snooping
IPv4 Multicast Snooping Table
(*, 224.0.0.0), uptime 17:46:23
  Incoming vlan: Vlan 2
  Outgoing interface list:
    TenGigabitEthernet 4/13
(*, 225.1.2.1), uptime 00:04:16
  Incoming vlan: Vlan 2
  Outgoing interface list:
    TenGigabitEthernet 4/11
    TenGigabitEthernet 4/13
(165.87.1.7, 225.1.2.1), uptime 00:03:17
  Incoming vlan: Vlan 2
  Outgoing interface list:
    TenGigabitEthernet 4/11
```

```
TenGigabitEthernet 4/13
TenGigabitEthernet 4/20
```

### Example (VLT)

```
Dell#show ip mroute vlt
IP Multicast Routing Table
Flags: S - Synced
(*, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
  Vlan 20 (S)
  Vlan 30

(50.1.1.2, 225.1.1.1), uptime 00:39:33 flags: S
Incoming interface: Vlan 10
Spanned outgoing interface list:
  Vlan 20 (S)
```

### Usage Information

The following describes the `show ip mroute` command shown in the following example.

| Field                    | Description                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (S, G)                   | Displays the forwarding entry in the multicast route table.                                                                                                                                                                                          |
| uptime                   | Displays the amount of time the entry has been in the multicast forwarding table.                                                                                                                                                                    |
| Incoming interface       | Displays the reverse path forwarding (RPF) information towards the source for (S,G) entries and the RP for (*,G) entries.                                                                                                                            |
| Outgoing interface list: | Lists the interfaces that meet one of the following: <ul style="list-style-type: none"><li>• a directly connected member of the Group</li><li>• statically configured member of the Group</li><li>• received a (*,G) or (S,G) Join message</li></ul> |

### Example

```
Dell#show ip mroute
IP Multicast Routing Table
(*, 224.10.10.1), uptime 00:05:12
  Incoming interface: TenGigabitEthernet 3/12
  Outgoing interface list:
    TenGigabitEthernet 3/13
(1.13.1.100, 224.10.10.1), uptime 00:04:03
  Incoming interface: TenGigabitEthernet 3/4
  Outgoing interface list:
    TenGigabitEthernet 3/12
    TenGigabitEthernet 3/13
(*, 224.20.20.1), uptime 00:05:12
  Incoming interface: TenGigabitEthernet 3/12
  Outgoing interface list:
    TenGigabitEthernet 3/4
```

## show ip rpf

View reverse path forwarding.

### S4820T

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <b>Syntax</b>        | show ip rpf                                                                 |
| <b>Command Modes</b> | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul> |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.1  | Introduced on the S4810.    |

#### E-Series legacy command

**Usage Information** Network administrators use static mroutes to control the reach-ability of the multicast sources. If a PIM-registered multicast source is reachable using static mroute as well as unicast route, the distance of each route is examined and the route with shorter distance is the one the PIM selects for reach-ability.

**NOTE:** The default distance of mroutes is zero (0) and is CLI configurable on a per route basis.

### Example

```
Dell#show ip rpf
RPF information for 10.10.10.9
RPF interface: Te 3/4
RPF neighbor: 165.87.31.4
RPF route/mask: 10.10.10.9/255.255.255.255
RPF type: unicast
```

## Neighbor Discovery Protocol (NDP)

The neighbor discovery protocol for IPv6 is defined in RFC 2461 as part of the Stateless Address Autoconfiguration protocol. It replaces the Address Resolution Protocol used with IPv4. NDP defines mechanisms for solving the following problems:

- Router discovery: Hosts can locate routers residing on a link
- Prefix discovery: Hosts can discover address prefixes for the link
- Parameter discovery
- Address autoconfiguration — configuration of addresses for an interface
- Address resolution — mapping from IP address to link-layer address
- Next-hop determination
- Neighbor unreachability detection (NUD): Determine that a neighbor is no longer reachable on the link.
- Duplicate address detection (DAD): Allow a node to check whether a proposed address is already in use.
- Redirect: The router can inform a node about a better first-hop.

NDP uses the following five ICMPv6 packet types in its implementation:

- Router Solicitation
- Router Advertisement
- Neighbor Solicitation
- Neighbor Advertisement
- Redirect

### clear ipv6 neighbors

Delete all entries in the IPv6 neighbor discovery cache or neighbors of a specific interface. Static entries are not removed using this command.

#### S4820T

**Syntax** `clear ipv6 neighbors [vrf vrf-name] [ipv6-address | interface]`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to clear the neighbor corresponding to that VRF.

**NOTE:** If you do not specify this option, the neighbors in the default VRF are cleared.

***ipv6-address***

Enter the IPv6 address of the neighbor in the x:x:x:x::x format to remove a specific IPv6 neighbor.

**NOTE:** The :: notation specifies successive hexadecimal fields of zero.

***interface  
interface***

To remove all neighbor entries learned on a specific interface, enter the keyword `interface` then the interface type and slot/port or number information of the interface:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.7(0.0) | Added support for VRF.      |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.1  | Introduced on the S4810.    |

# ipv6 neighbor

Configure a static entry in the IPv6 neighbor discovery.

## S4820T

### Syntax

```
ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface} {hardware_address}
```

To remove a static IPv6 entry from the IPv6 neighbor discovery, use the `no ipv6 neighbor [vrf vrf-name] {ipv6-address} {interface interface}` command.

### Parameters

**vrf vrf-name** (Optional) Enter the keyword `vrf` followed by the name of the VRF to install IPv6 routes in that VRF.

**ipv6-address** Enter the IPv6 address of the neighbor in the `x:x:x:x::x` format.

**NOTE:** The `::` notation specifies successive hexadecimal fields of zero.

**interface interface** Enter the keyword `interface` then the interface type and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a tunnel interface, enter the keyword `tunnel` then the tunnel interface number. The range is from 1 to 16383.

**hardware\_address** Enter a 48-bit hardware MAC address in `nn:nn:nn:nn:nn:nn` format.

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.7.1  | Introduced on the S4810.                           |

## show ipv6 neighbors

Display IPv6 discovery information. Entering the command without options shows all IPv6 neighbor addresses stored on the control processor (CP).

### S4820T

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                     | <code>show ipv6 neighbors [vrf <i>vrf-name</i>] [<i>ipv6-address</i>] interface <i>interface</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Parameters</b>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>vrf vrf-name</i></b>        | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to display the neighbors corresponding to that VRF.<br> <b>NOTE:</b> If you do not specify this option, neighbors corresponding to the default VRF are displayed.                                                                                                                                                                                                                                                                           |
| <b><i>ipv6-address</i></b>        | Enter the IPv6 address of the neighbor in the <code>x:x:x:x:x</code> format.<br> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                                                                                                                                                                                                                                                                               |
| <b><i>interface interface</i></b> | Enter the keyword <code>interface</code> then the interface type and slot/port or number information: <ul style="list-style-type: none"><li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <b>Defaults</b>                   | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

```

## IPv6 Router Advertisement (RA) Guard

The IPv6 RA guard provides support to perform conditional forwarding or blocking of the router advertisement messages that are received at the network device platform. This functionality analyzes and filters the RAs sent by the devices and compares the configuration information on the layer 2 device with the RA frame. Once the layer 2 device validates the content of the RA frame against the configuration, it forwards the RA to its unicast or multicast destination. On failure to validate the RA frame content, the RA frame is dropped.

The IPv6 RA guard supports two different modes:

- Host mode — When a policy with device role as host is applied on an interface, all the RA packets are dropped without validation. You can also configure the host mode policy with VLAN option to drop the RA packets on that specific VLAN and port.
- Router mode — When a policy with device role as router is applied on an interface, all the RA packets are validated based on the configuration information in the policy. Similarly, you can also apply this mode over any specific VLAN and the validation is performed only for that particular VLAN RA packets.

To configure the IPv6 RA guard, use the following Dell Networking OS commands.

## debug ipv6 nd ra-guard

Enable debugging for IPv6 RA guard snooping information.

**Syntax** `debug ipv6 nd ra-guard [interface_type slot/port | count value]`

### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface_type<br/>slot/port</b> | Enter the one of the following interfaces and slot/port information: <ul style="list-style-type: none"> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
| <b>count value</b>                  | Enter the keyword <code>count</code> then the number of debug outputs. The range is from 1 to 65534. The default is infinity.                                                                                                                                                                                                                                                                                                                                                 |

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

## device-role

Specify the role of the device attached to the port.

**Syntax** `device-role {host | router}`  
To reset the device role, use the `no device-role {host | router}` command.

| <b>Parameters</b>       | <p><b>host</b> Enter the keyword <code>host</code> to set the device-role as host.</p> <p><b>router</b> Enter the keyword <code>router</code> to set the device-role as router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |          |                                                                    |

## hop-limit

Enable the verification of the advertised hop count limit. If this command is not configured, the verification process is bypassed.

**Syntax** `hop-limit {maximum | minimum limit}`  
 To reset the hop count limit, use the `no hop-limit {maximum | minimum limit}` command.

|                   |                                                                                                                                                                                                                                                                 |

**Related Commands**

- [ipv6 nd ra-guard enable](#)—Allows you to configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — Defines the RA guard policy name and enter the RA guard policy configuration mode.

## ipv6 nd ra-guard attach-policy

Apply the IPv6 RA guard to a specific interface.

**Syntax** `ipv6 nd ra-guard attach-policy policy-name [vlan [vlan 1, vlan 2, vlan 3.....]]`

**Parameters**

**policy policy-name** Enter the keyword `policy` then the policy name. The policy-name allows a maximum of **140** characters.

**vlan [vlan 1, vlan 2, vlan 3.....]** Enter the keyword `vlan` then the VLAN range. The VLAN range is from 1 to 4094.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

[show ipv6 nd ra-guard policy](#) — Displays the configuration applied on all the RA guard policies or a specific RA guard policy.

## ipv6 nd ra-guard enable

Allow you to configure the RA guard related commands.

**Syntax** `ipv6 nd ra-guard enable`  
 To disable the RA guard, use the `no ipv6 nd ra-guard enable` command.

| <b>Related Commands</b> | <a href="#">ipv6 nd ra-guard enable</a> — Allows you to configure the RA guard related commands.                                                                                                                                                          |                                                                                                                        |

## managed-config-flag

Set the managed address configuration flag.

|               |                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>managed-config-flag {on   off}</code><br>To clear the flag, use the <code>no managed-config-flag {on   off}</code> command. |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------|

|                   |            |                                                                                 |
|-------------------|------------|---------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>on</b>  | Enter the keyword <code>on</code> to set the managed-config-flag value as ON.   |
|                   | <b>off</b> | Enter the keyword <code>off</code> to set the managed-config flag value as OFF. |

**Defaults** none

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — Defines the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## match ra

Enable verifying either of the configured source IPv6 address or prefix address or the source MAC address in the inspected messages. If this command is not configured, the verification process is bypassed.

**Syntax** `match ra {ipv6-access-list name | ipv6-prefix-list name | mac-access-list name}`  
 To reset the access list, use the `no match ra{ipv6-access-list | ipv6-prefix-list | mac-access-list}command`.

|                   |                                  |                                                                                                                                                         |
|-------------------|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>ipv6-access-list name</b>     | Enter the keywords <code>ipv6-access-list</code> then the access-list name. The access-list name allows a maximum of <b>140</b> characters.             |
|                   | <b>ipv6-prefix-list name</b>     | Enter the keywords <code>ipv6-prefix-list</code> then the prefix-list name. The prefix-list name allows a maximum of <b>140</b> characters.             |
|                   | <b>ipv6-mac-access-list name</b> | Enter the keywords <code>ipv6-mac-access-list</code> then the mac-access-list name. The mac-access-list name allows a maximum of <b>140</b> characters. |

**Defaults** none

## mtu

Enable the verification of the configured maximum transmission unit (MTU) value in the received RA packets.

**Syntax**

`mtu value`

To reset the MTU value, use the `no mtu value` command.

**Parameters**

**value** Enter the maximum transmission unit value in bytes. The range is from 1,280 to 11,982 bytes.

**Defaults**

0

**Command Modes**

POLICY LIST CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.

- [ipv6 nd rguard policy policy-name](#) — Defines the RA guard policy name and enter the RA guard policy configuration mode.

## other-config-flag

Enable the verification of the advertised other configuration parameter. If this command is not configured, the verification process is bypassed.

**Syntax** `other-config-flag {on | off}`  
 To reset the other configuration parameter, use the `no other-config-flag {on | off}` command.

**Parameters**

|            |                                                                               |
|------------|-------------------------------------------------------------------------------|
| <b>on</b>  | Enter the keyword <code>on</code> to set the other-config-flag value as ON.   |
| <b>off</b> | Enter the keyword <code>off</code> to set the other-config flag value as OFF. |

**Defaults** none

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.
- [ipv6 nd rguard policy policy-name](#) — Defines the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## reachable-time

Enable the verification of the configured reachability time in the received RA packets.

**Syntax** `reachable-time value`  
 To reset the advertised reachability time, use the `no reachable-timevalue` command.

**Parameters**                    **value**                    Enter the advertised reachability time in milliseconds. The range is from 0 to 3,600,000 milliseconds.

**Defaults**                    none

**Command Modes**            POLICY LIST CONFIGURATION

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

- Related Commands**
- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.
  - [ipv6 nd raguard policy policy-name](#) — Defines the RA guard policy name and enter the RA guard policy configuration mode.

## retrans-time

Enable the verification of the configured retransmission timer value in the received RA packets.

**Syntax**                    `retrans-timer value`  
To reset the advertised retransmission interval, use the `no retrans-timer value` command.

**Parameters**                    **value**                    Enter the advertised retransmission time interval in milliseconds. The range is from 100 to 4,294,967,295 milliseconds.

**Defaults**                    none

**Command Modes**            POLICY LIST CONFIGURATION

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands** [ipv6 nd rguard policy policy-name](#) — Defines the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## router-lifetime

Set the router lifetime.

**Syntax** `router-lifetime value`

**Parameters**

|              |                                                                             |
|--------------|-----------------------------------------------------------------------------|
| <b>value</b> | Enter the router lifetime in seconds. The range is from 0 to 9,000 seconds. |
|--------------|-----------------------------------------------------------------------------|

**Defaults** none

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.
- [ipv6 nd rguard policy policy-name](#) — Defines the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## router-preference maximum

Enable the verification of the advertised default router preference (DRP) value. The preference value is lower than or equal to the specified limit. If this command is not configured, the verification process is bypassed.

**Syntax** `router-preference maximum {high | low | medium}`

To reset the default router preference value, use the `no router-preference maximum {high | low | medium}` command.

|                   |               |                                                                       |
|-------------------|---------------|-----------------------------------------------------------------------|
| <b>Parameters</b> | <b>high</b>   | Enter the keyword <code>high</code> to set the DRP value as high.     |
|                   | <b>low</b>    | Enter the keyword <code>low</code> to set the DRP value as low.       |
|                   | <b>medium</b> | Enter the keyword <code>medium</code> to set the DRP value as medium. |

**Defaults** none

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Related Commands**

- [ipv6 nd ra-guard enable](#) — Allow you to configure the RA guard related commands.
- [ipv6 nd raguard policy policy-name](#) — Defines the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

## show config

Display the RA guard policy mode configurations.

**Syntax** `show config`

**Command Modes** POLICY LIST CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Example**

```
Dell(conf)#ipv6 nd ra-guard policy test
Dell(conf-ra_guard_policy_list)#show config
!
ipv6 nd ra-guard policy test
device-role router
```

```

hop-limit maximum 251
mtu 1350
other-config-flag on
reachable-time 540
retrans-timer 101
router-preference maximum medium
trusted-port
Dell(conf-ra_guard_policy_list)#

```

## Related Commands

- [ipv6 nd ra-guard enable](#) – Allows you to configure the RA guard related commands.
- [ipv6 nd ra-guard policy](#) – Defines the RA guard policy name and enter the RA guard policy list configuration mode.
- [device-role](#) – Specifies the role of the device attached to the port.
- [hop-limit](#) – Enables the verification of the advertised hop count limit.
- [mtu](#) – Sets the maximum transmission unit (MTU) value.
- [other-config-flag](#) – Enables the verification of the advertised other configuration parameter.
- [reachable-time](#) – Sets the advertised reachability time.
- [retrans-timer](#) – Sets the advertised retransmission time.
- [router-preference maximum](#) – Enables the verification of the advertised default router preference (DRP) value.
- [trusted-port](#) – Applies the policy to trusted ports.

## show ipv6 nd ra-guard policy

Display the configurations applied on all the RA guard policies or a specific RA guard policy.

**Syntax** `show ipv6 nd ra-guard policy policy-name`

**Parameter** `policy policy-name` Enter the keyword `policy` then the policy name. The policy name allows a maximum of **140** characters.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

## Example

```
Dell#show ipv6 nd ra-guard policy test

ipv6 nd ra-guard policy test
  device-role router
  hop-limit maximum 1
  match ra ipv6-access-list access
  other-config-flag on
  router-preference maximum medium
  trusted-port
  Interfaces :
    Te 1/1
Dell#
```

## Related Commands

- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.
- [ipv6 nd ra-guard policy](#) — Defines the RA guard policy name and enter the RA guard policy list configuration mode.
- [device-role](#) — Specifies the role of the device attached to the port.
- [hop-limit](#) — Enables the verification of the advertised hop count limit.
- [mtu](#) — Sets the maximum transmission unit (MTU) value.
- [other-config-flag](#) — Enables the verification of the advertised other configuration parameter.
- [reachable-time](#) — Sets the advertised reachability time.
- [retrans-timer](#) — Sets the advertised retransmission time.
- [router-preference maximum](#) — Enables the verification of the advertised default router preference (DRP) value.
- [trusted-port](#) — Applies the policy to trusted ports.
- [ipv6 nd raguard attach-policy](#) — Applies the IPv6 RA guard to a specific interface.

## trusted-port

Allow bypassing the configured RA guard validation and forwards the RA packets received on the interface, which has the trusted port policy attached.

### Syntax

```
trusted-port
```

To reset the policy applied to the trusted port, use the `no trusted-port` command.

### Defaults

```
none
```

### Command Modes

```
POLICY LIST CONFIGURATION
```

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                        |
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, and Z9000 switches. |

**Usage Information**

Use this command to disable all the RA guard policies.

**Related Commands**

- [ipv6 nd ra-guard enable](#) — Allows you to configure the RA guard related commands.
- [ipv6 nd rguard policy policy-name](#) — Defines the router advertisement (RA) guard policy name and enter the RA guard policy configuration mode.

# Object Tracking

Object Tracking supports IPv4 and IPv6, and is available on the Dell Networking, C-Series, E-Series, S-Series, and S4810 platforms.

Object tracking allows you to define objects of interest, monitor their state, and report to a client when a change in an object's state occurs. The following tracked objects are supported:

- Link status of Layer 2 interfaces
- Routing status of Layer 3 interfaces (IPv4 and IPv6)
- Reachability of IPv4 and IPv6 routes
- Metric thresholds of IPv4 and IPv6 routes

You can configure client applications, such virtual router redundancy protocol (VRRP), to receive a notification when the state of a tracked object changes.

This chapter contains the following sections:

- [IPv4 Object Tracking Commands](#)
- [IPv6 Object Tracking Commands](#)

## IPv4 Object Tracking Commands

The following section describes the IPv4 VRRP commands.

### debug track

Enables debugging for tracked objects.

|                   |                                                                                                          |                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>debug track [all   notifications   <i>object-id</i>]</code>                                        |                                                                                                          |
| <b>Parameters</b> | <b>all</b>                                                                                               | Enables debugging on the state and notifications of all tracked objects.                                 |
|                   | <b>notifications</b>                                                                                     | Enables debugging on the notifications of all tracked objects.                                           |
|                   | <b><i>object-id</i></b>                                                                                  | Enables debugging on the state and notifications of the specified tracked object. The range is 1 to 500. |
| <b>Defaults</b>   | Enable debugging on the state and notifications of all tracked objects ( <code>debug track all</code> ). |                                                                                                          |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

**Example**

```
Dell#debug track all

04:35:04: %RPM0-P:RP2 %OTM-5-STATE: track 6 - Interface
TenGigabitEthernet 1/2
line-protocol DOWN

04:35:04: %RPM0-P:RP2 %OTM-5-NOTIF: VRRP notification:
resource ID 6 DOWN
```

## delay

Configure the time delay used before communicating a change in the status of a tracked object to clients.

**Syntax**

```
delay {[up seconds] [down seconds]}
```

To return to the default setting, use the `no delay` command.

**Parameters**

**seconds** Enter the number of seconds the object tracker waits before sending a notification about the change in the UP and/or DOWN state of a tracked object to clients. The range is 0 to 180. The default is **0 seconds**.

**Defaults** **0 seconds**

**Command Modes** OBJECT TRACKING (*conf\_track\_object-id*)

**Command History**

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

**Usage Information**

You can configure an UP and/or DOWN timer for each tracked object to set the time delay before a change in the state of a tracked object is communicated to clients. The configured time delay starts when the state changes from UP to DOWN or vice-versa.

If the state of an object changes back to its former UP/DOWN state before the timer expires, the timer is cancelled and the client is not notified. For example, if the DOWN timer is running when an interface goes down and comes back up, the DOWN timer is cancelled and the client is not notified of the event.

If the timer expires and an object's state has changed, a notification is sent to the client. If no delay is configured, a notification is sent immediately after a change in the state of a tracked object is detected. The time delay in communicating a state change is specified in seconds.

#### Related Commands

- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.

## description

Enter a description of a tracked object.

#### Syntax

```
description {text}
```

To remove the description, use the `no description {text}` command.

#### Parameters

**text** Enter a description to identify a tracked object (80 characters maximum).

#### Defaults

none

#### Command Modes

OBJECT TRACKING (*conf\_track\_object-id*)

#### Command History

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

#### Related Commands

- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.

- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.

## show running-config track

Display the current configuration of tracked objects.

|                   |                                                |                                                                                        |
|-------------------|------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Syntax</b>     | show running-config track [ <i>object-id</i> ] |                                                                                        |
| <b>Parameters</b> | <b><i>object-id</i></b>                        | (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500. |

**Command Modes** EXEC Privilege

|                        |                |                             |
|------------------------|----------------|-----------------------------|
| <b>Command History</b> | <b>Version</b> | <b>Description</b>          |
|                        | 9.7(0.0)       | Introduced on the S6000-ON. |
|                        | 8.3.12.0       | Introduced on the S4810.    |
|                        | 8.4.1.0        | Introduced.                 |

**Example**

```
Dell#show running-config track

track 1 ip route 23.0.0.0/8 reachability

track 2 ipv6 route 2040::/64 metric threshold
delay down 3
delay up 5
threshold metric up 200

track 3 ipv6 route 2050::/64 reachability

track 4 interface TenGigabitEthernet 1/2 ip routing

track 5 ip route 192.168.0.0/24 reachability vrf red

track resolution ip route isis 20
track resolution ip route ospf 10
```

**Example (Object-id)**

```
Dell#show running-config track 300

track 300 ip route 10.0.0.0/8 metric threshold
delay down 3
delay up 5
threshold metric up 100
```

### Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.

- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.

## show track

Display information about tracked objects, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

**Syntax** `show track [object-id [brief] | interface [brief] [vrf vrf-name] | ip route [brief] [vrf vrf-name] | resolution | vrf vrf-name [brief] | brief]`

|                   |                     |                                                                                                                                                                                                                                                    |
|-------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>object-id</b>    | (OPTIONAL) Display information on the specified tracked object. The range is 1 to 500.                                                                                                                                                             |
|                   | <b>interface</b>    | (OPTIONAL) Display information on all tracked interfaces (Layer 2 and IPv4 Layer 3).                                                                                                                                                               |
|                   | <b>ip route</b>     | (OPTIONAL) Display information on all tracked IPv4 routes.                                                                                                                                                                                         |
|                   | <b>resolution</b>   | (OPTIONAL) Display information on the configured resolution values used to scale protocol-specific route metrics. The range is 0 to 255.                                                                                                           |
|                   | <b>brief</b>        | (OPTIONAL) Display a single line summary of the tracking information for a specified object, object type, or all tracked objects.                                                                                                                  |
|                   | <b>vrf vrf-name</b> | (OPTIONAL) E-Series only: Display information on only the tracked objects that are members of the specified VRF instance. The maximum is 32 characters. If you do not enter a VRF name, information on the tracked objects from all VRFs displays. |

**Command Modes** EXEC Privilege

|                        |                |                             |
|------------------------|----------------|-----------------------------|
| <b>Command History</b> | <b>Version</b> | <b>Description</b>          |
|                        | 9.7(0.0)       | Introduced on the S6000-ON. |
|                        | 8.3.12.0       | Introduced on the S4810.    |
|                        | 8.4.1.0        | Introduced.                 |

**Usage Information** The following describes the `show track` command shown in the Example below.

|                        |                                            |
|------------------------|--------------------------------------------|
| <b>Output</b>          | <b>Description</b>                         |
| Track <i>object-id</i> | Displays the number of the tracked object. |

| Output                                                                        | Description                                                                                                                           |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface type slot/port, IP route ip-address, IPv6 route ipv6-address</b> | Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.                             |
| <b>object is Up/Down</b>                                                      | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.                        |
| <b>number changes, last change time</b>                                       | Number of times that the state of the tracked object has changed and the time since the last change in <i>hours:minutes:seconds</i> . |
| <b>First hop interface</b>                                                    | Displays the type and slot/port number of the first-hop interface of the tracked route.                                               |
| <b>Tracked by</b>                                                             | Client that is tracking an object's state; for example, VRRP.                                                                         |

### Example

```
Dell#show track

Track 1
  IP route 23.0.0.0/8 reachability
  Reachability is Down (route not in route table)
    2 changes, last change 00:16:08
  Tracked by:

Track 2
  IPv6 route 2040::/64 metric threshold
  Metric threshold is Up (STATIC/0/0)
    5 changes, last change 00:02:16
  Metric threshold down 255 up 254
  First-hop interface is TenGigabitEthernet 1/2
  Tracked by:
    VRRP TenGigabitEthernet 2/3 IPv6 VRID 1

Track 3
  IPv6 route 2050::/64 reachability
  Reachability is Up (STATIC)
    5 changes, last change 00:02:16
  First-hop interface is TenGigabitEthernet 1/2
  Tracked by:
    VRRP TenGigabitEthernet 2/3 IPv6 VRID 1
```

### Usage Information

The following describes the `show track brief` command shown in the Example below.

| Output             | Description                                                    |
|--------------------|----------------------------------------------------------------|
| <b>ResID</b>       | Number of the tracked object.                                  |
| <b>Resource</b>    | Type of tracked object.                                        |
| <b>Parameter</b>   | Detailed description of the tracked object.                    |
| <b>State</b>       | Up or Down state of the tracked object.                        |
| <b>Last Change</b> | Time since the last change in the state of the tracked object. |

### Example (Brief)

```
Dell>show track brief
ResId Resource                Parameter      State LastChange
1      IP route reachability    10.16.0.0/16 Up    00:01:08
2      Interface line-protocol Ethernet0/2   Down 00:05:00
3      Interface ip routing     VLAN100       Up    01:10:05
```

### Related Commands

- [show running-config track](#) – displays configuration information about tracked objects.
- [track interface ip routing](#) – configures object tracking on the routing status of an IPv4 Layer 3 interface.
- [track interface line-protocol](#) – configures object tracking on the line-protocol state of a Layer 2 interface.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track ip route reachability](#) – configures object tracking on the reachability of an IPv4 route.
- 

## threshold metric

Configure the metric threshold used to determine the UP and/or DOWN state of a tracked IPv4 or IPv6 route.

### Syntax

```
threshold metric {up number | down number}
```

To return to the default setting, use the `no threshold metric {up number | down number}` command.

### Parameters

- up *number*** Enter a number for the UP threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default UP threshold is **254**. The routing state is UP if the scaled route metric is less than or equal to the UP threshold.
- down *number*** Enter a number for the DOWN threshold to be applied to the scaled metric of an IPv4 or IPv6 route. The default DOWN threshold is **255**. The routing state is DOWN if the scaled route metric is greater than or equal to the DOWN threshold.

### Defaults

none

### Command Modes

OBJECT TRACKING (conf\_track\_object-id)

### Command History

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

## Usage Information

Use this command to configure the UP and/or DOWN threshold for the scaled metric of a tracked IPv4 or IPv6 route.

Determine the UP/DOWN state of a tracked route by the threshold for the current value of the route metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value.

The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

Configure the UP and DOWN thresholds for each tracked route with the `threshold metric` command. The default UP threshold is 254; the default DOWN threshold is 255. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

The tracking process uses a protocol-specific resolution value to convert the actual metric in the routing table to a scaled metric in the range 0 to 255. You can configure the resolution value used to scale route metrics for supported protocols with the `track resolution ip route` and `track resolution ipv6 route` commands.

## Related Commands

- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.
- [track resolution ip route](#) – configures the protocol-specific resolution value used to scale an IPv4 route metric.

## track interface ip routing

Configure object tracking on the routing status of an IPv4 Layer 3 interface.

### Syntax

```
track object-id interface interface ip routing
```

To return to the default setting, use the `no track object-id` command.

### Parameters

- |                         |                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b> | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                                                                                                                                                                                   |
| <b><i>interface</i></b> | Enter one of the following values: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li></ul> |

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

| <b>Defaults</b>          | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |             |          |                             |          |                          |         |             |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|-----------------------------|----------|--------------------------|---------|-------------|
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                             |          |                          |         |             |

## track interface line-protocol

Configure object tracking on the line-protocol state of a Layer 2 interface.

**Syntax** `track object-id interface interface line-protocol`  
 To return to the default setting, use the `no track object-id` command.

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><b><i>object-id</i></b> Enter the ID number of the tracked object. The range is 1 to 500.</p> <p><b><i>interface</i></b> Enter one of the following values:</p> <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** none

**Command Modes** CONFIGURATION

| Command History | Version  | Description                 |
|-----------------|----------|-----------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON. |
|                 | 8.3.12.0 | Introduced on the S4810.    |
|                 | 8.4.1.0  | Introduced.                 |

**Usage Information** Use this command to create an object that tracks the line-protocol state of a Layer 2 interface by monitoring its operational status (UP or DOWN).

When the link-level status goes down, the tracked object status is considered to be DOWN; if the link-level status is up, the tracked object status is considered to be UP.

- Related Commands**
- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.

## track ip route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

**Syntax** `track object-id ip route ip-address/prefix-len metric threshold [vrf vrf-name]`

To return to the default setting, use the `no track object-id` command.

| Parameters                   |  |                                                                                                                                                                  |
|------------------------------|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>object-id</b>             |  | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                |
| <b>ip-address/prefix-len</b> |  | Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.                                                                |
| <b>vrf vrf-name</b>          |  | (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs. |

**Defaults** none

**Command Modes** CONFIGURATION

| <b>Command History</b> | <b>Version</b>  | <b>Description</b>          |
|------------------------|-----------------|-----------------------------|
|                        | <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
|                        | <b>8.3.12.0</b> | Introduced on the S4810.    |
|                        | <b>8.4.1.0</b>  | Introduced.                 |

**Usage Information** Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv4 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv4 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked route by using the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

**Related Commands**

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track resolution ip route](#) – configures the protocol-specific resolution value used to scale an IPv4 route metric.

## track ip route reachability

Configure object tracking on the reachability of an IPv4 route.

**Syntax** `track object-id ip route ip-address/prefix-len reachability [vrf vrf-name]`

To return to the default setting, use the `no track object-id` command.

### Parameters

|                              |                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>object-id</b>             | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                |
| <b>ip-address/prefix-len</b> | Enter an IPv4 address in dotted decimal format. The valid IPv4 prefix lengths are from /0 to /32.                                                                |
| <b>vrf vrf-name</b>          | (Optional) E-Series only: You can configure a VPN routing and forwarding (VRF) instance to specify the virtual routing table to which the tracked route belongs. |

**Defaults** none

**Command Modes** CONFIGURATION

### Command History

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

### Usage Information

Use this command to create an object that tracks the reachability of an IPv4 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.

A tracked IPv4 route is considered to match an entry in the routing table only if the exact IPv4 address and prefix length match a table entry. For example, when configured as a tracked route, 10.0.0.0/24 does not match the routing table entry 10.0.0.0/8. If no route-table entry has the exact IPv4 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure IPv4 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.

If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.

## Related Commands

- [show track](#) – displays information about tracked objects, including configuration, current state, and clients which track the object.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.

## track resolution ip route

Configure the protocol-specific resolution value used to scale an IPv4 route metric.

### Syntax

```
track resolution ip route {isis resolution-value | ospf resolution-value}
```

To return to the default setting, use the `no track object-id` command.

### Parameters

|                              |                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>object-id</b>             | Enter the ID number of the tracked object. The range is 1 to 500.                                        |
| <b>isis resolution-value</b> | Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric. |
| <b>ospf resolution-value</b> | Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric. |

### Defaults

none

### Command Modes

CONFIGURATION

### Command History

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

### Usage Information

Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv4 route in the routing table to a scaled metric in the range 0 to 255.

The UP/DOWN state of a tracked IPv4 route is determined by a user-configurable threshold (the `threshold metric` command) for the route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is **10**.

- For OSPF, you can set the resolution in the range 1 to 1592, where the default is **1**.
- The resolution value used to map static routes is not configurable. By default, Dell Networking OS assigns a metric of **0** to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

**Related Commands**

- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track ip route metric threshold](#) – configures object tracking on the threshold of an IPv4 route metric.

## IPv6 Object Tracking Commands

The following section describes the IPv6 object tracking commands.

The following object tracking commands apply to IPv4 and IPv6:

- [debug track](#)
- [delay](#)
- [description](#)
- [show running-config track](#)
- [threshold metric](#)
- [track interface line-protocol](#)

### show track ipv6 route

Display information about all tracked IPv6 routes, including configuration, current tracked state (UP or DOWN), and the clients which are tracking an object.

**Syntax** `show track ipv6 route [brief]`

**Parameters**

|              |                                                                                  |
|--------------|----------------------------------------------------------------------------------|
| <b>brief</b> | (OPTIONAL) Display a single line summary of information for tracked IPv6 routes. |
|--------------|----------------------------------------------------------------------------------|

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |

| Version | Description |
|---------|-------------|
| 8.4.1.0 | Introduced. |

**Usage Information**

The following describes the `show track ipv6 route` command shown in the Example below.

| Output                                                                                             | Description                                                                                                                           |
|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>Track <i>object-id</i></b>                                                                      | Displays the number of the tracked object.                                                                                            |
| <b>Interface <i>type slot/port</i>, IP route <i>ip-address</i>, IPv6 route <i>ipv6-address</i></b> | Displays the interface type and slot/port number or address of the IPv4/IPv6 route that is being tracked.                             |
| <b><i>object is Up/Down</i></b>                                                                    | Up/Down state of tracked object; for example, IPv4 interface, reachability or metric threshold of an IP route.                        |
| <b><i>number changes, last change time</i></b>                                                     | Number of times that the state of the tracked object has changed and the time since the last change in <i>hours:minutes:seconds</i> . |
| <b>First hop interface</b>                                                                         | Displays the type and slot/port number of the first-hop interface of the tracked route.                                               |
| <b>Tracked by</b>                                                                                  | Client that is tracking an object's state; for example, VRRP.                                                                         |

**Example**

```
Dell#show track ipv6 route

Track 2
  IPv6 route 2040::/64 metric threshold
  Metric threshold is Up (STATIC/0/0)
  5 changes, last change 00:02:30
  Metric threshold down 255 up 254
  First-hop interface is TenGigabitEthernet 1/2
  Tracked by:
    VRRP TenGigabitEthernet 2/4 IPv6 VRID 1

Track 3
  IPv6 route 2050::/64 reachability
  Reachability is Up (STATIC)
  5 changes, last change 00:02:30
  First-hop interface is TenGigabitEthernet 1/2
  Tracked by:
    VRRP TenGigabitEthernet 2/4 IPv6 VRID 1
```

**Usage Command**

The following describes the `show track ipv6 route brief` command shown in the Example below.

| Ouput            | Description                                 |
|------------------|---------------------------------------------|
| <b>ResID</b>     | Number of the tracked object.               |
| <b>Resource</b>  | Type of tracked object.                     |
| <b>Parameter</b> | Detailed description of the tracked object. |

| Ouput       | Description                                                    |
|-------------|----------------------------------------------------------------|
| State       | Up or Down state of the tracked object.                        |
| Last Change | Time since the last change in the state of the tracked object. |

#### Example (Brief)

```
Dell#show track ipv6 route brief

ResId Resource                               Parameter State LastChange
 2     IPv6 route metric threshold 2040::/64 Up 00:02:36
 3     IPv6 route reachability      2050::/64 Up 00:02:36
```

#### Related Commands

## track interface ipv6 routing

Configure object tracking on the routing status of an IPv6 Layer 3 interface.

#### Syntax

```
track object-id interface interface ipv6 routing
```

To return to the default setting, use the `no track object-id` command.

#### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>object-id</i></b> | Enter the ID number of the tracked object. The range is 1 to 500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>interface</i></b> | Enter one of the following values: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

#### Defaults

## track ipv6 route metric threshold

Configure object tracking on the threshold of an IPv4 route metric.

**Syntax** `track object-id ipv6 route ipv6-address/prefix-len metric threshold`

To return to the default setting, use the `no track object-id` command.

**Parameters**

|                                |                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------|
| <i>object-id</i>               | Enter the ID number of the tracked object. The range is 1 to 500.                           |
| <i>ipv6-address/prefix-len</i> | Enter an IPv6 address in X:X:X:X format. The valid IPv6 prefix lengths are from /0 to /128. |

**Defaults** none

## Usage Information

Use this command to create an object that tracks the UP and/or DOWN threshold of an IPv6 route metric. In order for a route's metric to be tracked, the route must appear as an entry in the routing table.

A tracked IPv6 route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the status of the tracked route is considered to be DOWN.

When you configure the threshold of an IPv6 route metric as a tracked object, the UP/DOWN state of the tracked route is also determined by the current metric for the route in the routing table.

To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible. The scaled metric value communicated to a client always considers a lower value to have priority over a higher value. The resulting scaled value is compared against the configured threshold values to determine the state of a tracked route as follows:

- If the scaled metric for a route entry is less than or equal to the UP threshold, the state of a route is UP.
- If the scaled metric for a route is greater than or equal to the DOWN threshold or the route is not entered in the routing table, the state of a route is DOWN.

You configure the UP and DOWN thresholds for each tracked IPv6 route by using the `threshold metric` command. The default UP threshold is **254**; the default DOWN threshold is **255**. The notification of a change in the state of a tracked object is sent when a metric value crosses a configured threshold.

## Related Commands

- [show track ipv6 route](#) – displays information about tracked IPv6 routes, including configuration, current state, and clients which track the route.
- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track resolution ipv6 route](#) – configures the protocol-specific resolution value used to scale an IPv6 route metric.

## track ipv6 route reachability

Configure object tracking on the reachability of an IPv6 route.

### Syntax

```
track object-id ipv6 route ip-address/prefix-len reachability
```

To return to the default setting, use the `no track object-id` command.

### Parameters

*object-id*

Enter the ID number of the tracked object. The range is 1 to 500.

| <b>Usage Information</b> | <p>Use this command to create an object that tracks the reachability of an IPv6 route. In order for a route's reachability to be tracked, the route must appear as an entry in the routing table.</p> <p>A tracked route is considered to match an entry in the routing table only if the exact IPv6 address and prefix length match a table entry. For example, when configured as a tracked route, 3333:100:200:300:400::/80 does not match routing table entry 3333:100:200:300::/64. If no route-table entry has the exact IPv6 address and prefix length, the tracked route is considered to be DOWN.</p> <p>When you configure IPv6 route reachability as a tracked object, the UP/DOWN state of the tracked route is also determined by the entry of the next-hop address in the ARP cache. A tracked route is considered to be reachable if there is an ARP cache entry for the route's next-hop address.</p> <p>If the next-hop address in the ARP cache ages out for a route tracked for its reachability, an attempt is made to regenerate the ARP cache entry to if the next-hop address appears before considering the route DOWN.</p> |                                                                                                                                                                                                                                                                                                                                     |                |                    |                 |                             |                 |                          |                |             |

## track resolution ipv6 route

Configure the protocol-specific resolution value used to scale an IPv6 route metric.

|               |                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>track resolution ipv6 route {isis resolution-value   ospf resolution-value}</pre> <p>To return to the default setting, use the <code>no track object-id</code> command.</p> |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Parameters

|                              |                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------|
| <i>object-id</i>             | Enter the ID number of the tracked object. Use the range to 1 to 500.                                    |
| <i>isis resolution-value</i> | Enter the resolution used to convert the metric in the routing table for ISIS routes to a scaled metric. |
| <i>ospf resolution-value</i> | Enter the resolution used to convert the metric in the routing table for OSPF routes to a scaled metric. |

## Defaults

none

## Command Modes

CONFIGURATION

## Command History

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.12.0 | Introduced on the S4810.    |
| 8.4.1.0  | Introduced.                 |

## Usage Information

Use this command to configure the protocol-specific resolution value that converts the actual metric of an IPv6 route in the routing table to a scaled metric in the range 0 to 255.

The UP/DOWN state of a tracked IPv6 route is determined by the user-configurable threshold (the `threshold metric` command) for a route's metric in the routing table. To provide a common tracking interface for different clients, route metrics are scaled in the range 0 to 255, where 0 is connected and 255 is inaccessible.

The protocol-specific resolution value calculates the scaled metric by dividing a route's cost by the resolution value set for the route protocol:

- For ISIS, you can set the resolution in the range 1 to 1000, where the default is 10.
- For OSPF, you can set the resolution in the range 1 to 1592, where the default is 1.
- The resolution value used to map static routes is not configurable. By default, Dell Networking OS assigns a metric of 0 to static routes.
- The resolution value used to map RIP routes is not configurable. The RIP hop-count is automatically multiplied by 16 to scale it. For example, a RIP metric of 16 (unreachable) scales to 256, which considers the route to be DOWN.

## Related Commands

- [threshold metric](#) – configures the metric threshold used to determine the UP and/or DOWN state of a tracked route.
- [track ipv6 route metric threshold](#) – configures object tracking on the threshold of an IPv6 route metric.

# Open Shortest Path First (OSPFv2 and OSPFv3)

Open Shortest Path First version 2 for IPv4 is supported on platform.

OSPF is an Interior Gateway Protocol (IGP), which means that it distributes routing information between routers in a single Autonomous System (AS). OSPF is also a link-state protocol in which all routers contain forwarding tables derived from information about their links to their neighbors.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) are the same for OSPFv2 and OSPFv3. OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis.

This chapter is divided into two sections. There is no overlap between the two sets of commands. You cannot use an OSPFv2 command in the IPv6 OSPFv3 mode.

- [Open Shortest Path First \(OSPFv2\)](#)

 **NOTE:** Dell Networking Operating System (OS) version 7.8.1.0 introduces Multi-Process OSPF on IPv4 (OSPFv2) only. It is not supported on OSPFv3 (IPv6).

The CLI requires that you include the Process ID when entering ROUTER-OSPF mode. Each command entered applies to the specified OSPFv2 process only.

## OSPFv2 Commands

The Dell Networking implementation of OSPFv2 is based on IETF RFC 2328. .

### area default-cost

Set the metric for the summary default route the area border router (ABR) generates into the stub area. Use this command on the border routers at the edge of a stub area.

#### S4820T

##### Syntax

```
area area-id default-cost cost
```

To return default values, use the `no area area-id default-cost` command.

##### Parameters

*area-id*

Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

**cost** Specifies the stub area's advertised external route metric. The range is from zero (0) to 65535.

**Defaults** `cost = 1`; no areas are configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information** In the Dell Networking operating software (OS), `cost` is defined as reference bandwidth/bandwidth.

**Related Commands** [area stub](#) — creates a stub area.

## area nssa

Specify an area as a not so stubby area (NSSA).

### S4820T

**Syntax** `area area-id nssa [default-information-originate] [no-redistribution] [no-summary]`

To delete an NSSA, use the `no area area-id nssa` command.

### Parameters

**area-id** Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

**no-redistribution** (OPTIONAL) Specify that the `redistribute` command does not distribute routes into the NSSA. Only use this command in an NSSA area border router (ABR).

|                                      |                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------|
| <b>default-information-originate</b> | (OPTIONAL) Allows external routing information to be imported into the NSSA by using Type 7 default. |
| <b>no-summary</b>                    | (OPTIONAL) Specify that no summary LSAs should be sent into the NSSA.                                |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## area range

Summarize routes matching an address/mask at an area border router (ABR).

### S4820T

**Syntax** `area area-id range ip-address mask [not-advertise]`  
 To disable route summarization, use the `no area area-id range ip-address mask` command.

**Parameters**

|                          |                                                                                                     |
|--------------------------|-----------------------------------------------------------------------------------------------------|
| <b><i>area-id</i></b>    | Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535. |
| <b><i>ip-address</i></b> | Specify an IP address in dotted decimal format.                                                     |
| <b><i>mask</i></b>       | Specify a mask for the destination prefix. Enter the full mask (for example, 255.255.255.0).        |

**not-advertise** (OPTIONAL) Enter the keywords `not-advertise` to set the status to DoNotAdvertise (that is, the Type 3 summary-LSA is suppressed and the component networks remain hidden from other areas.)

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information** Only the routes within an area are summarized, and that summary is advertised to other areas by the ABR. External routes are not summarized.

**Related Commands** [area stub](#) — creates a stub area.  
[router ospf](#) — enters ROUTER OSPF mode to configure an OSPF instance.

## area stub

Configure a stub area, which is an area not connected to other areas.

### S4820T

**Syntax** `area area-id stub [no-summary]`  
To delete a stub area, use the `no area area-id stub` command.

**Parameters** **area-id** Specify the OSPF area in dotted decimal format (A.B.C.D.) or enter a number from zero (0) to 65535.

**no-summary** (OPTIONAL) Enter the keywords `no-summary` to prevent the ABR from sending summary Link State Advertisements (LSAs) into the stub area.

**Defaults** Disabled.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information** To configure all routers and access servers within a stub, use this command.

**Related Commands** [router ospf](#) — enters ROUTER OSPF mode to configure an OSPF instance.

## auto-cost

Specify how the OSPF interface cost is calculated based on the reference bandwidth method.

### S4820T

**Syntax** `auto-cost [reference-bandwidth ref-bw]`  
To return to the default bandwidth or to assign cost based on the interface type, use the `no auto-cost [reference-bandwidth]` command.

**Parameters** ***ref-bw*** (OPTIONAL) Specify a reference bandwidth in megabits per second. The range is from 1 to 4294967. The default is **100 megabits per second**.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | <b>100 megabits per second.</b>                                                                                                                                |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>      | <b>Description</b>                        |
|---------------------|-------------------------------------------|
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.               |
| <b>9.0.2.0</b>      | Introduced on the S6000.                  |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                 |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                  |

| <b>7.8.1.0</b>      | Added support for the Multi-Process OSPF. |
| <b>7.6.1.0</b>      | Introduced on the S-Series.               |
| <b>7.5.1.0</b>      | Introduced on the C-Series.               |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.               |

## clear ip ospf

Clear all OSPF routing tables.

### S4820T

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip ospf <i>process-id</i> [<i>vrf vrf-name</i>] [<i>process</i>]</code>                                                                                                                                                                                                                                                                                                                                         |
| <b>Parameters</b>      | <p><b><i>process-id</i></b> Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.</p> <p><b><i>vrf vrf-name</i></b> Enter the keyword <code>vrf</code> and then the name of the VRF to clear all OSPF routing tables corresponding to that VRF.</p> <p><b><i>process</i></b> (OPTIONAL) Enter the keyword <code>process</code> to reset the OSPF process.</p> |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                              |

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.4.(0.0)    | Added support for VRF.                    |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## clear ip ospf statistics

Clear the packet statistics in interfaces and neighbors.

### S4820T

**Syntax** `clear ip ospf [process-id] [vrf vrf-name] statistics [interface name {neighbor router-id}]`

#### Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>     | Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>vrf vrf-name</i></b>   | Enter the keyword <code>vrf</code> followed by the name of the VRF to clear all OSPF routing tables corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>statistics</i></b>     | Enter the keyword <code>statistics</code> to clear the packet statistics in interfaces and neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>interface name</i></b> | (OPTIONAL) Enter the keyword <code>interface</code> then one of the following interface keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For Port Channel groups, enter the keywords <code>port-channel</code> then a number. For the C-Series and S-Series, the range is from 1 to 128.</li> <li>For a SONET interface, enter the keyword <code>sonet</code> then the slot/ port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

**neighbor  
router-id** (OPTIONAL) Enter the keyword `neighbor` then the neighbor's router-id in dotted decimal format (A.B.C.D.).

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Related Commands** [show ip ospf statistics](#) — displays the OSPF statistics.

## debug ip ospf

Display debug information on OSPF. Entering the `debug ip ospf` commands enables OSPF debugging for the first OSPF process.

### S4820T

**Syntax** `debug ip ospf [process-id] [vrf vrf-name] [bfd | event | packet | spf | database-timer rate-limit]`

To cancel the debug command, use the `no debug ip ospf` command.

### Parameters

**process-id** Enter the OSPF Process ID to clear a specific process. If no Process ID is entered, all OSPF processes are cleared.

**vrf vrf-name** Enter the keyword `vrf` to view debugging information on OSPF corresponding to that VRF.

**bfd** (OPTIONAL) Enter the keyword `bfd` to debug only OSPF BFD information.

|                                  |                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>event</b>                     | (OPTIONAL) Enter the keyword <code>event</code> to debug only OSPF event information.                                                                          |
| <b>packet</b>                    | (OPTIONAL) Enter the keyword <code>packet</code> to debug only OSPF packet information.                                                                        |
| <b>spf</b>                       | (OPTIONAL) Enter the keyword <code>spf</code> to display the Shortest Path First information.                                                                  |
| <b>database-timer rate-limit</b> | (OPTIONAL) Enter the keywords <code>database-timer rate-limit</code> to display the LSA throttling timer information. This applies to the S4810 platform only. |

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version             | Description                                                            |
|---------------------|------------------------------------------------------------------------|
| <b>9.4(0.0)</b>     | Added support for VRF. Introduced on the S6000-ON.                     |
| <b>9.0.2.0</b>      | Introduced on the S6000.                                               |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                                              |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                                               |
| <b>8.3.8.0</b>      | Added the <code>database-timer rate-limit</code> option for the S4810. |
| <b>8.3.7.0</b>      | Introduced on the S4810.                                               |
| <b>7.8.1.0</b>      | Added support for the Multi-Process OSPF.                              |
| <b>7.6.1.0</b>      | Introduced on the S-Series.                                            |
| <b>7.5.1.0</b>      | Introduced on the C-Series.                                            |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.                                            |

**Usage Information**

The following describes the `debug ip ospf` command shown in the Example below.

| Field       | Description                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------|
| <b>8:14</b> | Displays the time stamp.                                                                               |
| <b>OSPF</b> | Displays the OSPF process ID: instance ID.                                                             |
| <b>v:</b>   | Displays the OSPF version. Dell Networking OS supports version 2 only.                                 |
| <b>t:</b>   | Displays the type of packet sent: <ul style="list-style-type: none"> <li>• 1 - Hello packet</li> </ul> |

| <b>Field</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>chk:</b>        | Displays the OSPF checksum.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>aut:</b>        | States if OSPF authentication is configured. One of the following is listed: <ul style="list-style-type: none"> <li>• 0 - no authentication configured</li> <li>• 1 - simple authentication configured using the <code>ip ospf authentication-key</code> command</li> <li>• 2 - MD5 authentication configured using the <code>ip ospf message-digest-key</code> command</li> </ul>                                                                                                                                                                                               |
| <b>auk:</b>        | If the <code>ip ospf authentication-key</code> command is configured, this field displays the key used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>keyid:</b>      | If the <code>ip ospf message-digest-key</code> command is configured, this field displays the MD5 key                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>to:</b>         | Displays the interface to which the packet is intended.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>dst:</b>        | Displays the destination IP address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>netmask:</b>    | Displays the destination IP address mask.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>pri:</b>        | Displays the OSPF priority                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>N, MC, E, T</b> | Displays information available in the Options field of the HELLO packet: <ul style="list-style-type: none"> <li>• N + (N-bit is set)</li> <li>• N - (N-bit is not set)</li> <li>• MC+ (bit used by MOSPF is set and router is able to forward IP multicast packets)</li> <li>• MC- (bit used by MOSPF is not set and router cannot forward IP multicast packets)</li> <li>• E + (router is able to accept AS External LSAs)</li> <li>• E - (router cannot accept AS External LSAs)</li> <li>• T + (router can support TOS)</li> <li>• T - (router cannot support TOS)</li> </ul> |
| <b>hi:</b>         | Displays the amount of time configured for the HELLO interval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field       | Description                                                   |
|-------------|---------------------------------------------------------------|
| <b>di:</b>  | Displays the amount of time configured for the DEAD interval. |
| <b>dr:</b>  | Displays the IP address of the designated router.             |
| <b>bdr:</b> | Displays the IP address of the Border Area Router.            |

### Example

```
Dell#debug ip ospf 1 packet
OSPF process 90, packet debugging is on

Dell#
08:14:24 : OSPF(100:00):
Xmt. v:2 t:1(HELLO) l:44 rid:192.1.1.1
      aid:0.0.0.1 chk:0xa098 aut:0 auk: keyid:0 to:Te 4/3 dst:
224.0.0.5
      netmask:255.255.255.0 pri:1 N-, MC-, E+, T-,
      hi:10 di:40 dr:90.1.1.1 bdr:0.0.0.0
```

## default-information originate

To generate a default external route into an OSPF routing domain, configure Dell Networking Operating System (OS).

### Syntax

```
default-information originate [always] [metric metric-value]
[metric-type type-value] [route-map map-name]
```

To return to the default values, use the `no default-information originate` command.

### Parameters

|                                      |                                                                                                                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                        | (OPTIONAL) Enter the keyword <code>always</code> to specify that default route information must always be advertised.                                                                                                                                |
| <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number to configure a metric value for the route. The range is from 1 to 16777214.                                                                                                           |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then an OSPF link state type of 1 or 2 for default routes. The values are: <ul style="list-style-type: none"> <li>• 1 = Type 1 external route</li> <li>• 2 = Type 2 external route</li> </ul> |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map.                                                                                                                                                      |

### Defaults

Disabled.

### Command Modes

ROUTER OSPF

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## Related Commands

redistribute — redistributes routes from other routing protocols into OSPF.

## default-metric

Change the metrics of redistributed routes to a value useful to OSPF. Use this command with the `redistribute` command.

### S4820T

#### Syntax

```
default-metric number
```

To return to the default values, use the `no default-metric [number]` command.

#### Parameters

***number*** Enter a number as the metric. The range is from 1 to 16777214.

#### Defaults

Disabled.

#### Command Modes

ROUTER OSPF

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## description

Add a description about the selected OSPF configuration.

### S4820T

#### Syntax

`description description`

To remove the OSPF description, use the `no description` command.

#### Parameters

***description*** Enter a text string description to identify the OSPF configuration (80 characters maximum).

#### Defaults

none

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.               |
| 9.0.2.0  | Introduced on the S6000.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 7.8.1.0  | Added support for the Multi-Process OSPF. |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Related Commands** [show ip ospf asbr](#) — displays the VLAN configuration.

## distance

Define an administrative distance for particular routes to a specific IP address.

### S4820T

**Syntax** `distance weight [ip-address mask access-list-name]`  
 To delete the settings, use the `no distance weight [ip-address mask access-list-name]` command.

#### Parameters

|                         |                                                                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>weight</b>           | Specify an administrative distance. The range is from 1 to 255. The default is <b>110</b> .                                    |
| <b>ip-address</b>       | (OPTIONAL) Enter a router ID in the dotted decimal format. If you enter a router ID, include the mask for that router address. |
| <b>mask</b>             | (OPTIONAL) Enter a mask in dotted decimal format or /n format.                                                                 |
| <b>access-list-name</b> | (OPTIONAL) Enter the name of an IP standard access list, up to 140 characters.                                                 |

**Defaults** **110**

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version      | Description                               |
|--------------|-------------------------------------------|
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## distance ospf

Configure an OSPF distance metric for different types of routes.

### S4820T

**Syntax** `distance ospf [external dist3] [inter-area dist2] [intra-area dist1]`  
 To delete these settings, use the `no distance ospf` command.

### Parameters

|                                |                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>external <i>dist3</i></b>   | (OPTIONAL) Enter the keyword <code>external</code> then a number to specify a distance for external type 5 and 7 routes. The range is from 1 to 255. The default is <b>110</b> .        |
| <b>inter-area <i>dist2</i></b> | (OPTIONAL) Enter the keywords <code>inter-area</code> then a number to specify a distance metric for routes between areas. The range is from 1 to 255. The default is <b>110</b> .      |
| <b>intra-area <i>dist1</i></b> | (OPTIONAL) Enter the keywords <code>intra-area</code> then a number to specify a distance metric for all routes within an area. The range is from 1 to 255. The default is <b>110</b> . |

### Defaults

- `external dist3 = 110`
- `inter-area dist2 = 110`
- `intra-area dist1 = 110`

### Command Modes

ROUTER OSPF

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description                               |
|----------|-------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 7.8.1.0  | Added support for the Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.               |
| 7.5.1.0  | Introduced on the C-Series.               |
| 6.1.1.1  | Introduced on the E-Series.               |

**Usage Information** To specify a distance for routes learned from other routing domains, use the `redistribute` command.

## distribute-list in

Apply a filter to incoming routing updates from OSPF to the routing table.

### S4820T

**Syntax** `distribute-list prefix-list-name in [interface]`  
 To delete a filter, use the `no distribute-list prefix-list-name in [interface]` command.

### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>prefix-list-name</i></b> | Enter the name of a configured prefix list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>interface</i></b>        | (OPTIONAL) Enter one of the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For Port Channel groups, enter the keywords <code>port-channel</code> then a number. For the C-Series, S-Series, and Z9000, the range is from 1 to 128. For Z9500, the range is from 1 to 512.</li> <li>For a SONET interface, enter the keyword <code>sonet</code> then the slot/port information.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.2(1.0)     | Introduced on the Z9500.                  |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

## distribute-list out

To restrict certain routes destined for the local routing table after the SPF calculation, apply a filter.

### S4820T

#### Syntax

```
distribute-list prefix-list-name out [bgp | connected | isis | rip | static]
```

To remove a filter, use the `no distribute-list prefix-list-name out [bgp | connected | isis | rip | static]` command.

#### Parameters

***prefix-list-name***

Enter the name of a configured prefix list.

**bgp**

(OPTIONAL) Enter the keyword `bgp` to specify that BGP routes are distributed.

**NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.

**connected**

(OPTIONAL) Enter the keyword `connected` to specify that connected routes are distributed.

**isis**

(OPTIONAL) Enter the keyword `isis` to specify that IS-IS routes are distributed.

**NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.

**rip** (OPTIONAL) Enter the keyword `rip` to specify that RIP routes are distributed.

**NOTE:** BGP and ISIS routes are not available on the C-Series. BGP, ISIS, and RIP routes are not available on the S-Series.

**static** (OPTIONAL) Enter the keyword `static` to specify that only manually configured routes are distributed.

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                               |
|--------------|-------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.               |
| 9.0.2.0      | Introduced on the S6000.                  |
| 8.3.19.0     | Introduced on the S4820T.                 |
| 8.3.11.1     | Introduced on the Z9000.                  |
| 8.3.7.0      | Introduced on the S4810.                  |
| 7.8.1.0      | Added support for the Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.               |
| 7.5.1.0      | Introduced on the C-Series.               |
| pre- 6.1.1.1 | Introduced on the E-Series.               |

**Usage Information** The `distribute-list out` command applies to routes autonomous system boundary routers (ASBRs) redistributes into OSPF. It can be applied to external type 2 and external type 1 routes, but not to intra-area and inter-area routes.

## enable inverse-mask

By default, Dell Networking Operating System (OS) allows you to input the OSPF `network` command with a net-mask. This command provides a choice between inverse-mask or net-mask (the default).

### S4820T

**Syntax**                    `enable inverse mask`  
To return to the default net-mask, use the `no enable inverse mask` command.

**Defaults**                **net-mask**

**Command Modes**        CONFIGURATION

**Command History**        This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.1      | Introduced on the S4810.    |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## fast-convergence

This command sets the minimum LSA origination and arrival times to zero (0), allowing more rapid route computation so that convergence takes less time.

### S4820T

**Syntax**                    `fast-convergence {number}`  
To cancel fast-convergence, use the `no fast convergence` command.

**Parameters**            **number**                    Enter the convergence level desired. The higher this parameter is set, the faster OSPF converge takes place. The range is from 1 to 4.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | none.                                                                                                                                                          |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                  |
|-----------------|------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.  |
| <b>9.0.2.0</b>  | Introduced on the S6000.     |
| <b>8.3.19.0</b> | Introduced on the S4820T.    |
| <b>8.3.11.1</b> | Introduced on the Z9000.     |
| <b>8.3.7.0</b>  | Introduced on the S4810.     |
| <b>7.8.1.0</b>  | Introduced on all platforms. |

#### Usage Information

The higher this parameter is set, the faster OSPF converge takes place.

**NOTE:** The faster the convergence, the more frequent the route calculations and updates. This behavior impacts CPU utilization and may impact adjacency stability in larger topologies.

Generally, convergence level 1 meets most convergence requirements. Higher convergence levels should only be selected following consultation with Dell Networking technical support.

## graceful-restart grace-period

Specifies the time duration, in seconds, that the router's neighbors continue to advertise the router as fully adjacent regardless of the synchronization state during a graceful restart.

**NOTE:** This command enables OSPFv2 graceful restart globally by setting the grace period (in seconds) that an OSPFv2 router's neighbors continues to advertise the router as adjacent during a graceful restart.

### S4820T

#### Syntax

```
graceful-restart grace-period seconds
```

To disable the grace period, use the `no graceful-restart grace-period` command.

#### Parameters

***seconds***

Time duration, in seconds, that specifies the duration of the restart process before OSPF terminates the process. The range is from 40 to 1800 seconds.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Not Configured                                                                                                                                                 |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                                       |
|--------------|-------------------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                                       |
| 9.0.2.0      | Introduced on the S6000.                                          |
| 8.3.19.0     | Introduced on the S4820T.                                         |
| 8.3.11.1     | Introduced on the Z9000.                                          |
| 8.3.7.0      | Introduced on the S4810.                                          |
| 7.8.1.0      | Introduced on the S-Series. Added support for Multi-Process OSPF. |
| 7.5.1.0      | Introduced on the C-Series.                                       |
| pre- 6.1.1.1 | Introduced on the E-Series.                                       |

|                          |                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | The Helper mode is enabled by default on the device. To enable the restart mode also on the device, you must configure the grace period using this command. After you enable restart mode the router advertises the neighbor as fully adjacent during a restart. |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## graceful-restart helper-reject

Specify the OSPF router to not act as a helper during graceful restart.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>graceful-restart helper-reject ip-address</code><br>To return to default value, use the <code>no graceful-restart helper-reject</code> command.          |
| <b>Parameters</b>      | <b><i>ip-address</i></b> Enter the OSPF router-id, in IP address format, of the restart router that <i>will not</i> act as a helper during graceful restart.   |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                                                                                                                                                  |
| 9.0.2.0      | Introduced on the S6000.                                                                                                                                                     |
| 8.3.19.0     | Introduced on the S4820T.                                                                                                                                                    |
| 8.3.11.1     | Introduced on the Z9000.                                                                                                                                                     |
| 8.3.12.0     | Introduced on the S4810.                                                                                                                                                     |
| 7.8.1.0      | <code>Restart</code> role enabled on the S-Series (Both <code>Helper</code> and <code>Restart</code> roles now supported on S-Series). Added support for Multi-Process OSPF. |
| 7.7.1.0      | Added <code>Helper-Role</code> support on the S-Series.                                                                                                                      |
| 7.5.1.0      | Introduced on the C-Series.                                                                                                                                                  |
| pre- 6.1.1.1 | Introduced on the E-Series.                                                                                                                                                  |

## graceful-restart mode

Enable the graceful restart mode.

### S4820T

**Syntax** `graceful-restart mode [planned-only | unplanned-only]`  
To disable graceful restart mode, use the `no graceful-restart mode` command.

**Parameters**

|                       |                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>planned-only</b>   | (OPTIONAL) Enter the keywords <code>planned-only</code> to indicate graceful restart is supported in a planned restart condition only.      |
| <b>unplanned-only</b> | (OPTIONAL) Enter the keywords <code>unplanned-only</code> to indicate graceful restart is supported in an unplanned restart condition only. |

**Defaults** Support for both planned and unplanned failures.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.12.0     | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## graceful-restart role

Specify the role for your OSPF router during graceful restart.

### S4820T

#### Syntax

```
graceful-restart role [helper-only | restart-only]
```

To disable graceful restart role, use the `no graceful-restart role` command.

#### Parameters

**role helper-only**

(OPTIONAL) Enter the keywords `helper-only` to specify the OSPF router is a helper only during graceful restart.

**role restart-only**

(OPTIONAL) Enter the keywords `restart-only` to specify the OSPF router is a restart only during graceful-restart.

#### Defaults

By default, OSPF routers are both helper and restart routers during a graceful restart.

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.12.0 | Introduced on the S4810.    |

| Version      | Description                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| 7.8.1.0      | Added support for Multi-Process OSPF. Added <code>Restart</code> and <code>Helper</code> roles support on the S-Series. |
| 7.7.1.0      | Added <code>Helper-Role</code> support on the S-Series.                                                                 |
| 7.5.1.0      | Introduced on the C-Series.                                                                                             |
| pre- 6.1.1.1 | Introduced on the E-Series.                                                                                             |

## ip ospf auth-change-wait-time

OSPF provides a grace period while OSPF changes its interface authentication type. During the grace period, OSPF sends out packets with new and old authentication scheme until the grace period expires.

### S4820T

**Syntax** `ip ospf auth-change-wait-time seconds`  
 To return to the default, use the `no ip ospf auth-change-wait-time` command.

**Parameters** `seconds` Enter the seconds. The range is from 0 to 300.

**Defaults** **zero (0) seconds.**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## ip ospf authentication-key

Enable authentication and set an authentication key on OSPF traffic on an interface.

### S4820T

**Syntax** `ip ospf authentication-key [encryption-type] key`  
To delete an authentication key, use the `no ip ospf authentication-key` command.

**Parameters**

|                               |                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------|
| <b><i>encryption-type</i></b> | (OPTIONAL) Enter 7 to encrypt the key.                                               |
| <b><i>key</i></b>             | Enter an eight-character string. Strings longer than eight characters are truncated. |

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information** All neighboring routers in the same network must use the same password to exchange OSPF information.

## ip ospf cost

Change the cost associated with the OSPF traffic on an interface.

### S4820T

#### Syntax

```
ip ospf cost cost
```

To return to default value, use the `no ip ospf cost` command.

#### Parameters

**cost** Enter a number as the cost. The range is from 1 to 65535.

#### Defaults

The default cost is based on the reference bandwidth.

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

#### Usage Information

If this command is not configured, cost is based on the `auto-cost` command.

When you configure OSPF over multiple vendors, to ensure that all routers use the same cost, use the `ip ospf cost` command. Otherwise, OSPF routes improperly.

#### Related Commands

[auto-cost](#) — controls how the OSPF interface cost is calculated.

## ip ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the interval elapses, the neighboring routers declare the router dead.

### S4820T

**Syntax** `ip ospf dead-interval seconds`  
To return to the default values, use the `no ip ospf dead-interval` command.

**Parameters** `seconds` Enter the number of seconds for the interval. The range is from 1 to 65535. The default is **40 seconds**.

**Defaults** **40 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information** By default, the dead interval is four times the default hello-interval.

**Related Commands** [ip ospf hello-interval](#) — sets the time interval between the hello packets.

## ip ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

### S4820T

**Syntax** `ip ospf hello-interval seconds`  
To return to the default value, use the `no ip ospf hello-interval` command.

**Parameters** `seconds` Enter the number of seconds for the interval. The range is from 1 to 65535. The default is **10 seconds**.

**Defaults** **10 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information** The time interval between the hello packets must be the same for routers in a network.

**Related Commands** [ip ospf dead-interval](#) — sets the time interval before a router is declared dead.

## ip ospf message-digest-key

Enable OSPF MD5 authentication and send an OSPF message digest key on the interface.

### S4820T

**Syntax** `ip ospf message-digest-key keyid md5 key`  
To delete a key, use the `no ip ospf message-digest-key keyid` command.

**Parameters**

|              |                                                           |
|--------------|-----------------------------------------------------------|
| <i>keyid</i> | Enter a number as the key ID. The range is from 1 to 255. |
| <i>key</i>   | Enter a continuous character string as the password.      |

**Defaults** No MD5 authentication is configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                                                |
| 9.0.2.0      | Introduced on the S6000.                                                   |
| 8.3.19.0     | Introduced on the S4820T.                                                  |
| 9.1(0.0)     | Included usage information on maximum number of digest keys per interface. |
| 8.3.11.1     | Introduced on the Z9000.                                                   |
| 8.3.7.0      | Introduced on the S4810.                                                   |
| 7.6.1.0      | Introduced on the S-Series.                                                |
| 7.5.1.0      | Introduced on the C-Series.                                                |
| pre- 6.1.1.1 | Introduced on the E-Series.                                                |

**Usage Information** You can configure a maximum of six digest keys on an interface. Of the available six digest keys, the switches select the MD5 key that is common. The remaining MD5 keys are unused.

To change to a different key on the interface, enable the new key while the old key is still enabled. Dell Networking OS sends two packets: the first packet authenticated with the old key and the second packet authenticated with the new key. This process ensures that the neighbors learn the new key and communication is not disrupted by keeping the old key enabled.

After the reply is received and the new key is authenticated, delete the old key. Dell recommends keeping only one key per interface.

**NOTE:** The MD5 secret is stored as plain text in the configuration file with service password encryption. Write down or otherwise record the key. You cannot learn the key once it is configured. Use caution when changing the key.

## ip ospf mtu-ignore

Disable OSPF MTU mismatch detection upon receipt of database description (DBD) packets.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ospf mtu-ignore</code><br>To return to the default, use the <code>no ip ospf mtu-ignore</code> command.                                               |
| <b>Defaults</b>        | Enabled.                                                                                                                                                       |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## ip ospf network

Set the network type for the interface.

### S4820T

|               |                                                           |
|---------------|-----------------------------------------------------------|
| <b>Syntax</b> | <code>ip ospf network {broadcast   point-to-point}</code> |
|---------------|-----------------------------------------------------------|

To return to the default, use the `no ip ospf network` command.

|                        |                                                                                                                                                                |                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b>broadcast</b>                                                                                                                                               | Enter the keyword <code>broadcast</code> to designate the interface as part of a broadcast network.            |
|                        | <b>point-to-point</b>                                                                                                                                          | Enter the keywords <code>point-to-point</code> to designate the interface as part of a point-to-point network. |
| <b>Defaults</b>        | Broadcast.                                                                                                                                                     |                                                                                                                |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                |

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>      | <b>Description</b>                    |
|---------------------|---------------------------------------|
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.           |
| <b>9.0.2.0</b>      | Introduced on the S6000.              |
| <b>8.3.19.0</b>     | Introduced on the S4820T.             |
| <b>8.3.11.1</b>     | Introduced on the Z9000.              |
| <b>8.3.7.0</b>      | Introduced on the S4810.              |
| <b>7.8.1.0</b>      | Added support for Multi-Process OSPF. |
| <b>7.6.1.0</b>      | Introduced on the S-Series.           |
| <b>7.5.1.0</b>      | Introduced on the C-Series.           |
| <b>pre- 6.1.1.1</b> | Introduced on the E-Series.           |

## ip ospf priority

To determine the designated router for the OSPF network, set the priority of the interface.

### S4820T

**Syntax** `ip ospf priority number`  
To return to the default setting, use the `no ip ospf priority` command.

**Parameters** *number* Enter a number as the priority. The range is from 0 to 255. The default is **1**.

**Defaults** **1**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information** Setting a priority of 0 makes the router ineligible for election as a designated router or backup designated router.

Use this command for interfaces connected to multi-access networks, not point-to-point networks.

## ip ospf retransmit-interval

Set the retransmission time between lost link state advertisements (LSAs) for adjacencies belonging to the interface.

### S4820T

**Syntax** `ip ospf retransmit-interval seconds`  
To return to the default values, use the `no ip ospf retransmit-interval` command.

**Parameters** *seconds* Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is **5 seconds**.  
This interval must be greater than the expected round-trip time for a packet to travel between two routers.

**Defaults** **5 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

**Usage Information** Set the time interval to a number large enough to prevent unnecessary retransmissions.

## ip ospf transmit-delay

To send a link state update packet on the interface, set the estimated time elapsed.

### S4820T

**Syntax** `ip ospf transmit-delay seconds`  
To return to the default value, use the `no ip ospf transmit-delay` command.

**Parameters** `seconds` Enter the number of seconds as the interval between retransmission. The range is from 1 to 3600. The default is **1 second**.  
This value must be greater than the transmission and propagation delays for the interface.

**Defaults** **1 second**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## log-adjacency-changes

To send a Syslog message about changes in the OSPF adjacency state, set Dell Networking OS.

### S4820T

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | log-adjacency-changes<br>To disable the Syslog messages, use the no log-adjacency-changes command.                                                             |
| <b>Defaults</b>        | Disabled.                                                                                                                                                      |
| <b>Command Modes</b>   | ROUTER OSPF                                                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                           |
|--------------|---------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.           |
| 9.0.2.0      | Introduced on the S6000.              |
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

## maximum-paths

Enable the software to forward packets over multiple paths.

### S4820T

|                        |                                                                                                                                                                                                                     |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>maximum-paths <i>number</i></code><br>To disable packet forwarding over multiple paths, use the <code>no maximum-paths</code> command.                                                                        |
| <b>Parameters</b>      | <b><i>number</i></b> Specify the number of paths. The range for OSPFv2 is from 1 to 64. The default for OSPFv2 is <b>4 paths</b> . The range for OSPFv3 is from 1 to 64. The default for OSPFv3 is <b>8 paths</b> . |
| <b>Defaults</b>        | <b>4</b>                                                                                                                                                                                                            |
| <b>Command Modes</b>   | ROUTER OSPF for OSPFv2<br>ROUTER OSPFv3 for OSPFv3                                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                      |

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                           |
|--------------|-------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                           |
| 9.0.2.0      | Introduced on the S6000.                              |
| 9.1(0.0)     | Introduced support for OSPFv3 on the S4810 and Z9000. |
| 8.3.19.0     | Introduced on the S4820T.                             |
| 8.3.11.1     | Introduced on the Z9000.                              |
| 8.3.7.0      | Introduced on the S4810.                              |
| 7.8.1.0      | Added support for Multi-Process OSPF.                 |
| 7.6.1.0      | Introduced on the S-Series.                           |
| 7.5.1.0      | Introduced on the C-Series.                           |
| pre- 6.1.1.1 | Introduced on the E-Series.                           |

## network area

Define which interfaces run OSPF and the OSPF area for those interfaces.

### S4820T

**Syntax** `network ip-address mask area area-id`  
To disable an OSPF area, use the `no network ip-address mask area area-id` command.

**Parameters**

|                          |                                                                                                                                                                        |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b> | Specify a primary or secondary address in dotted decimal format. The primary address is required before adding the secondary address.                                  |
| <b><i>mask</i></b>       | Enter a network mask in /prefix format. (/x)                                                                                                                           |
| <b><i>area-id</i></b>    | Enter the OSPF area ID as either a decimal value or in a valid IP address. Decimal value range is from 0 to 65535. IP address format is dotted decimal format A.B.C.D. |

 **NOTE:** If the area ID is smaller than 65535, it is converted to a decimal value. For example, if you use an area ID of 0.0.0.1, it is converted to 1.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                  |
|--------------|------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.  |
| 9.0.2.0      | Introduced on the S6000.     |
| 8.3.19.0     | Introduced on the S4820T.    |
| 8.3.11.1     | Introduced on the Z9000.     |
| 8.3.7.0      | Introduced on the S4810.     |
| 7.8.1.0      | Introduced to all platforms. |
| 7.6.1.0      | Introduced on the S-Series.  |
| 7.5.1.0      | Introduced on the C-Series.  |
| pre- 6.1.1.1 | Introduced on the E-Series.  |

## Usage Information

To enable OSPF on an interface, the `network area` command must include, in its range of addresses, the primary IP address of an interface.

**NOTE:** An interface can be attached only to a single OSPF area.

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

## passive-interface

Suppress both receiving and sending routing updates on an interface.

### S4820T

#### Syntax

```
passive-interface {default | interface}
```

To enable both the receiving and sending routing, use the `no passive-interface interface` command.

To return all OSPF interfaces (current and future) to active, use the `no passive-interface default` command.

#### Parameters

##### **default**

Enter the keyword `default` to make all OSPF interfaces (current and future) passive.

##### **interface**

Enter the following keywords and slot/port or number information:

- For a Gigabit Ethernet interface, enter the keyword `GigabitEthernet` then the slot/port information.
- For Port Channel groups, enter the keywords `port-channel` then a number. For the C-Series, S-Series, and Z9000, the range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                            |
|--------------|--------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                            |
| 9.0.2.0      | Introduced on the S6000.                               |
| 8.3.19.0     | Introduced on the S4820T.                              |
| 8.3.11.1     | Introduced on the Z9000.                               |
| 8.3.7.0      | Introduced on the S4810.                               |
| 7.8.1.0      | Added support for Multi-Process OSPF.                  |
| 7.6.1.0      | Introduced on the S-Series.                            |
| 7.5.1.0      | Introduced on the C-Series.                            |
| 7.4.1.0      | Modified to include the keyword <code>default</code> . |
| pre- 6.1.1.1 | Introduced on the E-Series.                            |

### Usage Information

Although the passive interface does not send or receive routing updates, the network on that interface is still included in OSPF updates sent using other interfaces.

The `default` keyword sets all interfaces as passive. You can then configure individual interfaces, where adjacencies are desired, using the `no passive-interface interface` command. The `no` form of this command is inserted into the configuration for individual interfaces when the `no passive-interface interface` command is issued while `passive-interface default` is configured.

This command behavior has changed as follows:

`passive-interface interface`

- The previous `no passive-interface interface` is removed from the running configuration.
- The ABR status for the router is updated.
- Save `passive-interface interface` into the running configuration.

`passive-interface default`

- All present and future OSPF interfaces are marked as *passive*.
- Any adjacency is explicitly terminated from all OSPF interfaces.
- All previous `passive-interface interface` commands are removed from the running configuration.
- All previous `no passive-interface interface` commands are removed from the running configuration.

`no passive-interface interface`

- Remove the interface from the passive list.
- The ABR status for the router is updated.

- If `passive-interface default` is specified, then save no `passive-interface interface` into the running configuration.

No `passive-interface default`

- Clear everything and revert to the default behavior.
- All previously marked passive interfaces are removed.
- May update ABR status.

On configuring suppression using the `passive-interface` command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

## redistribute

Redistribute information from another routing protocol throughout the OSPF process.

### S4820T

#### Syntax

```
redistribute {connected | isis | ospf | rip | static} [metric
metric-value | metric-type type-value] [route-map map-name]
[tag tag-value]
```

To disable redistribution, use the `no redistribute {connected | isis | rip | static}` command.

#### Parameters

|                                      |                                                                                                                                                                                                    |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                     | Enter the keyword <code>connected</code> to specify that information from active routes on interfaces is redistributed.                                                                            |
| <b>isis</b>                          | Enter the keyword <code>isis</code> to specify that ISO IS-IS information is redistributed.                                                                                                        |
| <b>ospf</b>                          | Enter the keyword <code>ospf</code> to specify that information corresponding to OSPF is redistributed.                                                                                            |
| <b>rip</b>                           | Enter the keyword <code>rip</code> to specify that RIP routing information is redistributed.                                                                                                       |
| <b>static</b>                        | Enter the keyword <code>static</code> to specify that information from static routes is redistributed.                                                                                             |
| <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number. The range is from 0 (zero) to 16777214.                                                                                            |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"> <li>• 1 = OSPF External type 1</li> <li>• 2 = OSPF External type 2</li> </ul> |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                               |

|                          | <b>tag tag-value</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | (OPTIONAL) Enter the keyword <code>tag</code> then a number. The range is from 0 to 4294967295. |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                                       |         |                             |         |                             |              |                             |

## Parameters

|                                      |                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>as number</i></b>              | Enter the autonomous system number. The range is from 1 to 65535.                                                                                                                                       |
| <b><i>metric metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then the metric-value number. The range is from 0 to 16777214.                                                                                         |
| <b><i>metric-type type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"><li>• 1 = for OSPF External type 1</li><li>• 2 = for OSPF External type 2</li></ul> |
| <b><i>route-map map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                                    |
| <b><i>tag tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.                                                                     |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                     |
|--------------|-------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                     |
| 9.0.2.0      | Introduced on the S6000.                        |
| 8.3.19.0     | Introduced on the S4820T.                       |
| 8.3.11.1     | Introduced on the Z9000.                        |
| 8.3.7.0      | Introduced on the S4810.                        |
| 7.8.1.3      | Added Route Map for BGP Redistribution to OSPF. |
| 7.8.1.0      | Added support for Multi-Process OSPF.           |
| 7.6.1.0      | Introduced on the S-Series.                     |
| 7.5.1.0      | Introduced on the C-Series.                     |
| 7.4.1.0      | Added the keyword <code>default</code> .        |
| pre- 6.1.1.1 | Introduced on the E-Series.                     |

## redistribute isis

Redistribute IS-IS routing information throughout the OSPF instance.

### S4820T

**Syntax** `redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]`

To disable redistribution, use the `no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]` command.

### Parameters

|                               |                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tag</b>                    | (OPTIONAL) Enter the name of the IS-IS routing process.                                                                                                                                                 |
| <b>level-1</b>                | (OPTIONAL) Enter the keywords <code>level-1</code> to redistribute only IS-IS Level-1 routes.                                                                                                           |
| <b>level-1-2</b>              | (OPTIONAL) Enter the keywords <code>level-1-2</code> to redistribute both IS-IS Level-1 and Level-2 routes.                                                                                             |
| <b>level-2</b>                | (OPTIONAL) Enter the keywords <code>level-2</code> to redistribute only IS-IS Level-2 routes.                                                                                                           |
| <b>metric metric-value</b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number. The range is from 0 (zero) to 4294967295.                                                                                               |
| <b>metric-type type-value</b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then one of the following: <ul style="list-style-type: none"><li>• 1 = for OSPF External type 1</li><li>• 2 = for OSPF External type 2</li></ul> |
| <b>route-map map-name</b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of the route map.                                                                                                                    |
| <b>tag tag-value</b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPF. The range is from 0 to 4294967295.                                                                     |

**Defaults** Not configured.

| pre- 6.1.1.1 | Introduced on the E-Series.           |

## router-id

To configure a fixed router ID, use this command.

### S4820T

**Syntax** `router-id ip-address`  
 To remove the fixed router ID, use the `no router-id ip-address` command.

**Parameters** `ip-address` Enter the router ID in the IP address format.

**Defaults** none.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                           |
|--------------|---------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.           |
| 9.0.2.0      | Introduced on the S6000.              |
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

**Usage Information** You can configure an arbitrary value in the IP address format for each router. However, each router ID must be unique. If you use this command on an OSPF router process, which is already active (that is, has neighbors), a prompt reminding you that changing the router-id brings down the existing OSPF adjacency. The new router ID is effective at the next reload.

**Example**

```
Dell(conf)#router ospf 100
Dell(conf-router_ospf)#router-id 1.1.1.1
Changing router-id will bring down existing OSPF adjacency [y/n]:

Dell(conf-router_ospf)#show config
!
router ospf 100
router-id 1.1.1.1
Dell(conf-router_ospf)#no router-id
Changing router-id will bring down existing OSPF adjacency [y/n]:
Dell#
```

## router ospf

To configure an OSPF instance, enter ROUTER OSPF mode.

### S4820T

**Syntax** `router ospf process-id [vrf {vrf name}]`  
To clear an OSPF instance, use the `no router ospf process-id` command.

**Parameters**

|                   |                                                                                                                                                                   |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>process-id</i> | Enter a number for the OSPF instance. The range is from 1 to 65535.                                                                                               |
| <i>vrf name</i>   | (Optional) Enter the VRF process identifier to tie the OSPF instance to the VRF. All network commands under this OSPF instance are then tied to the VRF instance. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                      |
|----------|--------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                      |
| 9.0.2.0  | Introduced on the S6000.                         |
| 9.1(0.0) | Added support for OSPFv3 on the S4810 and Z9000. |

| Version      | Description                           |
|--------------|---------------------------------------|
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.9.1.0      | Added support for VRF.                |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

**Usage Information**

You must have an IP address assigned to an interface to enter ROUTER OSPF mode and configure OSPF.

After the OSPF process and the VRF are tied together, you cannot use the OSPF Process ID again in the system.

**Example**

```
Dell(conf)#router ospf 2
Dell(conf-router_ospf)#
```

## show config

Display the non-default values in the current OSPF configuration.

### S4820T

**Syntax**

`show config`

**Command Modes**

ROUTER OSPF

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version      | Description                 |
|--------------|-----------------------------|
| pre- 6.1.1.1 | Introduced on the E-Series. |

#### Example

```
Dell(conf-router_ospf)#show config
!
router ospf 3
passive-interface 0 TenGigabitEthernet 1/1
Dell(conf-router_ospf)#
```

## show ip ospf

Display information on the OSPF process configured on the switch.

### S4820T

#### Syntax

```
show ip ospf [process-id | vrf vrf name]
```

#### Parameters

|                            |                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. |
| <b><i>vrf vrf name</i></b> | Show only the OSPF information tied to the VRF process.                                                                            |

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                           |
|----------|-----------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                           |
| 9.4(0.0) | Added support for VRF.                                                |
| 9.0.2.0  | Introduced on the S6000.                                              |
| 8.3.19.0 | Introduced on the S4820T.                                             |
| 8.3.11.1 | Introduced on the Z9000.                                              |
| 8.3.8.0  | Added output for LSA throttling timers.                               |
| 8.3.7.0  | Introduced on the S4810.                                              |
| 7.9.1.0  | Added support for VRF.                                                |
| 7.8.1.0  | Added support of Multi-Process OSPF.                                  |
| 7.8.1.0  | Added the <i>process-id</i> option, in support of Multi-Process OSPF. |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

### Usage Information

If you delete all the network area commands for Area 0, the `show ip ospf` command output does not list Area 0.

The following describes the `show ip ospf` command shown in the following example.

| Line Beginning with  | Description                                                                     |
|----------------------|---------------------------------------------------------------------------------|
| "Routing Process..." | Displays the OSPF process ID and the IP address associated with the process ID. |
| "Supports only..."   | Displays the number of Type of Service (TOS) routes supported.                  |
| "SPF schedule..."    | Displays the delay and hold time configured for this process ID.                |
| "Convergence Level"  |                                                                                 |
| "Min LSA..."         | Displays the intervals set for LSA transmission and acceptance.                 |
| "Number of..."       | Displays the number and type of areas configured for this process ID.           |

### Example

```
Dell#show ip ospf 10
Routing Process ospf 10 with ID 1.1.1.1 Virtual router default-
vrf
Supports only single TOS (TOS0) routes
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Convergence Level 0
Min LSA origination 0 msec, Min LSA arrival 1000 msec
Min LSA hold time 5000 msec, Max LSA wait time 5000 msec
Number of area in this router is 1, normal 1 stub 0 nssa 0
  Area BACKBONE (0)
    Number of interface in this area is 1
    SPF algorithm executed 205 times
    Area ranges are
Dell#
```

### Related Commands

[show ip ospf database](#) — displays information about the OSPF routes configured.

[show ip ospf interface](#) — displays the OSPF interfaces configured.

[show ip ospf neighbor](#) — displays the OSPF neighbors configured.

## show ip ospf asbr

Display all autonomous system boundary router (ASBR) routers visible to OSPF.

### S4820T

| <b>Syntax</b>              | <code>show ip ospf [<i>process-id</i>   vrf <i>vrf-name</i>] asbr</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                          |                                                                                                                                    |                            |                                                                                                                                                         |           |                        |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                                                                       |         |                             |         |                                          |

| 7.8.1.0                    | Added the <i>process-id</i> option, in support of Multi-Process OSPF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                          |                                                                                                                                    |                            |                                                                                                                                                         |           |                        |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                                                                       |         |                             |         |                                          |
| 7.6.1.0                    | Introduced on the S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                          |                                                                                                                                    |                            |                                                                                                                                                         |           |                        |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                                                                       |         |                             |         |                                          |
| 7.5.1.0                    | Introduced on the C-Series and E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                          |                                                                                                                                    |                            |                                                                                                                                                         |           |                        |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                                                                       |         |                             |         |                                          |
| <b>Usage Information</b>   | To isolate problems with external routes, use this command. In OSPF, external routes are calculated by adding the LSA cost to the cost of reaching the ASBR router. If an external route does not have the correct cost, use this command to determine if the path to the originating router is correct. The display output is not sorted in any order.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                          |                                                                                                                                    |                            |                                                                                                                                                         |           |                        |         |                          |          |                           |          |                          |         |                          |         |                                      |         |                                                                       |         |                             |         |                                          |

**NOTE:** ASBRs that are not in directly connected areas are also displayed.

You can determine if an ASBR is in a directly connected area (or not) by the flags. For ASBRs in a directly connected area, E flags are set. In the following example, router 1.1.1.1 is in a directly connected area since the Flag is E/-/-/. For remote ASBRs, the E flag is clear (-/-/-/).

#### Example

```
Dell#show ip ospf lasbr

RouterID  Flags  Cost Nexthop  Interface Area
3.3.3.3   -/-/-/  2   10.0.0.2   Te 1/1    1
1.1.1.1   E/-/-/  0   0.0.0.0    -         0
Dell#
```

## show ip ospf database

Display all LSA information. If you do not enable OSPF on the switch, no output is generated.

### S4820T

**Syntax** `show ip ospf process-id [vrf vrf-name] database [database-summary]`

#### Parameters

|                                |                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>       | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.            |
| <b><i>vrf vrf-name</i></b>     | Enter the keyword <code>vrf</code> and then the name of the VRF to view LSA information on OSPF processes corresponding to that VRF.          |
| <b><i>database-summary</i></b> | (OPTIONAL) Enter the keywords <code>database-summary</code> to the display the number of LSA types in each area and the total number of LSAs. |

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.4(0.0) | Added support for VRF.      |
| 9.0.2.0  | Introduced on the S6000.    |

| Version      | Description                          |
|--------------|--------------------------------------|
| 8.3.19.0     | Introduced on the S4820T.            |
| 8.3.11.1     | Introduced on the Z9000.             |
| 8.3.7.0      | Introduced on the S4810.             |
| 7.8.1.0      | Added support of Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.          |
| 7.5.1.0      | Introduced on the C-Series.          |
| pre- 6.1.1.1 | Introduced on the E-Series.          |

### Usage Information

The following describes the `show ip ospf process-id database` command shown in the following example.

| Field      | Description                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------|
| Link ID    | Identifies the router ID.                                                                                                 |
| ADV Router | Identifies the advertising router's ID.                                                                                   |
| Age        | Displays the link state age.                                                                                              |
| Seq#       | Identifies the link state sequence number. This number allows you to identify old or duplicate link state advertisements. |
| Checksum   | Displays the Fletcher checksum of an LSA's complete contents.                                                             |
| Link count | Displays the number of interfaces for that router.                                                                        |

### Example

```
Dell>show ip ospf 1 database

      OSPF Router with ID (11.1.2.1) (Process ID 1)
      Router (Area 0.0.0.0)
Link ID      ADV Router   Age   Seq#           Checksum Link count

Dell>

```

**Related Commands**      [show ip ospf database asbr-summary](#) — displays only ASBR summary LSA information.

## show ip ospf database asbr-summary

Display information about autonomous system (AS) boundary LSAs.

### S4820T

**Syntax**                    `show ip ospf [process-id | vrf vrf-name] database asbr-summary [link-state-id] [adv-router ip-address]`

#### Parameters

- |                                     |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                               |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view display information about AS boundary LSAs corresponding to a specific VRF.                                                                                                                                                                                                                           |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>• the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the <code>ip-address</code> to display only the LSA information about that router.                                                                                                                                                                                                                                     |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.4.(0.0) | Added support for VRF.      |

| Version      | Description                           |
|--------------|---------------------------------------|
| 9.0.2.0      | Introduced on the S6000.              |
| 8.3.19.0     | Introduced on the S4820T.             |
| 8.3.11.1     | Introduced on the Z9000.              |
| 8.3.7.0      | Introduced on the S4810.              |
| 7.8.1.0      | Added support for Multi-Process OSPF. |
| 7.6.1.0      | Introduced on the S-Series.           |
| 7.5.1.0      | Introduced on the C-Series.           |
| pre- 6.1.1.1 | Introduced on the E-Series.           |

### Usage Information

The following describes the `show ip ospf database asbr-summary` command shown in the following example.

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| LS Type            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Link State ID      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Advertising Router | Identifies the advertising router's ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Checksum           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Length             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Network Mask       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TOS                | Displays the Type of Service (TOS) options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Metric             | Displays the LSA metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Example

```
Dell#show ip ospf 100 database asbr-summary
      OSPF Router with ID (1.1.1.10) (Process ID 100)
      Summary Asbr (Area 0.0.0.0)
```

```

LS age: 1437
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 103.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x8000000f
Checksum: 0x8221
Length: 28
Network Mask: /0
      TOS: 0 Metric: 2

```

```

LS age: 473
Options: (No TOS-capability, No DC, E)
LS type: Summary Asbr
Link State ID: 104.1.50.1
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000010
Checksum: 0x4198
Length: 28
--More--

```

**Related Commands**      [show ip ospf database](#) — displays OSPF database information.

## show ip ospf database external

Display information on the AS external (type 5) LSAs.

### S4820T

**Syntax**                    `show ip ospf [process-id | vrf vrf-name] database external [link-state-id] [adv-router ip-address]`

#### Parameters

- |                                     |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                               |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view information on AS external LSAs corresponding to the OSPF processes that are tied to a specific VRF.                                                                                                                                                                                                  |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>• the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                                  |

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                           |
|-------------|---------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.           |
| 9.4(0.0)    | Added support for VRF.                |
| 9.0.2.0     | Introduced on the S6000.              |
| 8.3.19.0    | Introduced on the S4820T.             |
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

## Usage Information

The following describes the `show ip ospf process-id database external` command shown in the following example.

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Options            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"><li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li><li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li><li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li></ul> |
| LS Type            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Link State ID      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Advertising Router | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LS Seq Number      | Identifies the link state sequence number. This number enables you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                          |

| Field              | Description                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Checksum           | Displays the Fletcher checksum of the LSA's complete contents.                                                                                                                        |
| Length             | Displays the length in bytes of the LSA.                                                                                                                                              |
| Network Mask       | Displays the network mask implemented on the area.                                                                                                                                    |
| Metrics Type       | Displays the external type.                                                                                                                                                           |
| TOS                | Displays the Type of Service (TOS) options. Option 0 is the only option.                                                                                                              |
| Metric             | Displays the LSA metric.                                                                                                                                                              |
| Forward Address    | Identifies the address of the forwarding router. Data traffic is forwarded to this router. If the forwarding address is 0.0.0.0, data traffic is forwarded to the originating router. |
| External Route Tag | Displays the 32-bit field attached to each external route. The OSPF protocol does not use this field, but you can use the field for external route management.                        |

### Example

```
Dell#show ip ospf 1 database external

      OSPF Router with ID (20.20.20.5) (Process ID 1)

          Type-5 AS External

LS age: 612
Options: (No TOS-capability, No DC, E)
LS type: Type-5 AS External
Link State ID: 12.12.12.2
Advertising Router: 20.31.3.1
LS Seq Number: 0x80000007
Checksum: 0x4cde
Length: 36
Network Mask: /32
    Metrics Type: 2
    TOS: 0
    Metrics: 25
    Forward Address: 0.0.0.0
    External Route Tag: 43

LS age: 1868
Options: (No TOS-capability, DC)
LS type: Type-5 AS External
Link State ID: 24.216.12.0
Advertising Router: 20.20.20.8
LS Seq Number: 0x80000005
Checksum: 0xa00e
Length: 36
Network Mask: /24
    Metrics Type: 2
    TOS: 0
    Metrics: 1
    Forward Address: 0.0.0.0
    External Route Tag: 701
Dell#
```

Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf database network

Display the network (type 2) LSA information.

### S4820T

**Syntax** `show ip ospf [process-id | vrf vrf-name] database network [link-state-id] [adv-router ip-address]`

**Parameters**

- |                                     |                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                           |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view the network LSA information corresponding to an OSPF process that is tied to a specific VRF.                                                                                                                                                                                                      |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li><li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li><li>• the default destination (0.0.0.0) for Type 5 LSAs</li></ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                              |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.4.(0.0) | Added support for VRF.      |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.19.0  | Introduced on the S4820T.   |

| Version     | Description                           |
|-------------|---------------------------------------|
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

### Usage Information

The following describes the `show ip ospf process-id database network` command shown in the following example.

| Field              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age             | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| LS Type            | Displays the LSA's type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Link State ID      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Advertising Router | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Checksum           | Identifies the link state sequence number. This number enables you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                              |
| Length             | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Network Mask       | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Attached Router    | Identifies the IP address of routers attached to the network.                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Example

```
Dell#show ip ospf 1 data network
      OSPF Router with ID (20.20.20.5) (Process ID 1)
        Network (Area 0.0.0.0)
          LS age: 1372
          Options: (No TOS-capability, DC, E)
          LS type: Network
          Link State ID: 202.10.10.2
          Advertising Router: 20.20.20.8
          LS Seq Number: 0x80000006
          Checksum: 0xa35
```

```

Length: 36
Network Mask: /24
    Attached Router: 20.20.20.8
    Attached Router: 20.20.20.9
    Attached Router: 20.20.20.7

    Network (Area 0.0.0.1)

LS age: 252
Options: (TOS-capability, No DC, E)
LS type: Network
Link State ID: 192.10.10.2
Advertising Router: 192.10.10.2
LS Seq Number: 0x80000007
Checksum: 0x4309
Length: 36
Network Mask: /24
    Attached Router: 192.10.10.2
    Attached Router: 20.20.20.1
    Attached Router: 20.20.20.5
Dell#

```

**Related Commands**      [show ip ospf database](#) — displays OSPF database information.

## show ip ospf database nssa-external

Display NSSA-External (type 7) LSA information.

### S4820T

**Syntax**                    `show ip ospf [process-id | vrf vrf-name] database nssa-external [link-state-id] [adv-router ip-address]`

#### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                               |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view NSSA-External LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                       |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>• the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>• the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> and the ip-address to display only the LSA information about that router.                                                                                                                                                                                                                                                  |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                           |
|-------------|---------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.           |
| 9.4(0.0)    | Added support for VRF.                |
| 9.0.2.0     | Introduced on the S6000.              |
| 8.3.19.0    | Introduced on the S4820T.             |
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

## Related Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf database opaque-area

Display the opaque-area (type 10) LSA information.

### S4820T

#### Syntax

```
show ip ospf [process-id | vrf vrf-name] database opaque-area  
[link-state-id] [adv-router ip-address]
```

#### Parameters

- |                             |                                                                                                                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>    | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                          |
| <b><i>vrf vrf-name</i></b>  | Enter the keyword <code>vrf</code> followed by the name of the VRF to view opaque-area LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                    |
| <b><i>link-state-id</i></b> | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>• the network's IP address for Type 3 LSAs or Type 5 LSAs</li></ul> |

- the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs
- the default destination (0.0.0.0) for Type 5 LSAs

**adv-router ip-address**

(OPTIONAL) Enter the keywords `adv-router` and the ip-address to display only the LSA information about that router.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

**Usage Information**

The following describes the `show ip ospf process-id database opaque-area` command shown in the following example.

| Item    | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age  | Displays the LSA's age.                                                                                                                                                                                                                                                                                                                                                                           |
| Options | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> </ul> |

| Item               | Description                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                    | <ul style="list-style-type: none"> <li>E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| LS Type            | Displays the LSA's type.                                                                                                                |
| Link State ID      | Displays the Link State ID.                                                                                                             |
| Advertising Router | Identifies the advertising router's ID.                                                                                                 |
| Checksum           | Displays the Fletcher checksum of the LSA's complete contents.                                                                          |
| Length             | Displays the length in bytes of the LSA.                                                                                                |
| Opaque Type        | Displays the Opaque type field (the first 8 bits of the Link State ID).                                                                 |
| Opaque ID          | Displays the Opaque type-specific ID (the remaining 24 bits of the Link State ID).                                                      |

### Example

```
Dell>show ip ospf 1 database opaque-area

      OSPF Router with ID (3.3.3.3) (Process ID 1)
      Type-10 Opaque Link Area (Area 0)

LS age: 1133
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.1
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000416
Checksum: 0x376
Length: 28
Opaque Type: 1
Opaque ID: 1
Unable to display opaque data

LS age: 833
Options: (No TOS-capability, No DC, E)
LS type: Type-10 Opaque Link Area
Link State ID: 1.0.0.2
Advertising Router: 10.16.1.160
LS Seq Number: 0x80000002
Checksum: 0x19c2
--More--
```

### Related Commands

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.0.2.0  | Introduced on the S6000.              |
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.11.1 | Introduced on the Z9000.              |
| 8.3.7.0  | Introduced on the S4810.              |
| 7.8.1.0  | Added support for Multi-Process OSPF. |
| 7.6.1.0  | Introduced on the S-Series.           |
| 7.5.1.0  | Introduced on the C-Series.           |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.1.1.1 | Introduced on the E-Series. |

**Related Commands** [show ip ospf database](#) — displays OSPF database information.

## show ip ospf database opaque-link

Display the opaque-link (type 9) LSA information.

### S4820T

**Syntax** `show ip ospf [process-id | vrf vrf-name] database opaque-link [link-state-id] [adv-router ip-address]`

#### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                         |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view opaque-link LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                   |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> then the IP address of an Advertising Router to display only the LSA information about that router.                                                                                                                                                                                                                  |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.4.(0.0) | Added support for VRF.      |

| Version     | Description                           |
|-------------|---------------------------------------|
| 9.0.2.0     | Introduced on the S6000.              |
| 8.3.19.0    | Introduced on the S4820T.             |
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

**Related Commands**      [show ip ospf database](#) — displays OSPF database information.

## show ip ospf database router

Display the router (type 1) LSA information.

### S4820T

**Syntax**      `show ip ospf [process-id | vrf vrf-name] database router [link-state-id] [adv-router ip-address]`

| Parameters                          |                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                         |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view the router LSA information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                    |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"> <li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li> <li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li> <li>the default destination (0.0.0.0) for Type 5 LSAs</li> </ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> followed by the IP address of an Advertising Router to display only the LSA information about that router.                                                                                                                                                                                                           |

## Usage Information

The following describes the `show ip ospf process-id database router` command shown in the following example.

| Item               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age             | Displays the LSA age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Options            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"><li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li><li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li><li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li></ul> |
| LS Type            | Displays the LSA type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Link State ID      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Advertising Router | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LS Seq Number      | Displays the link state sequence number. This number detects duplicate or old LSAs.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Checksum           | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Length             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Item                        | Description                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Number of Links</b>      | Displays the number of active links to the type of router (Area Border Router or AS Boundary Router) listed in the previous line. |
| <b>Link connected to:</b>   | Identifies the type of network to which the router is connected.                                                                  |
| <b>(Link ID)</b>            | Identifies the link type and address.                                                                                             |
| <b>(Link Data)</b>          | Identifies the router interface address.                                                                                          |
| <b>Number of TOS Metric</b> | Lists the number of TOS metrics.                                                                                                  |
| <b>TOS 0 Metric</b>         | Lists the number of TOS 0 metrics.                                                                                                |

### Example

```
Dell#show ip ospf 100 database router
      OSPF Router with ID (1.1.1.10) (Process ID 100)
          Router (Area 0)
LS age: 967
Options: (No TOS-capability, No DC, E)
LS type: Router
Link State ID: 1.1.1.10
Advertising Router: 1.1.1.10
LS Seq Number: 0x8000012f
Checksum: 0x3357
Length: 144
AS Boundary Router
Area Border Router
  Number of Links: 10
    Link connected to: a Transit Network
      (Link ID) Designated Router address: 192.68.129.1
      (Link Data) Router Interface address: 192.68.129.1
      Number of TOS metric: 0
      TOS 0 Metric: 1
    Link connected to: a Transit Network

```

## Related Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf database summary

Display the network summary (type 3) LSA routing information.

### S4820T

#### Syntax

```
show ip ospf [process-id | vrf vrf-name] database summary
[link-state-id] [adv-router ip-address]
```

#### Parameters

|                                     |                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>            | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                     |
| <b><i>vrf vrf-name</i></b>          | Enter the keyword <code>vrf</code> followed by the name of the VRF to view LSA routing information corresponding to the OSPF process that is tied to a specific VRF.                                                                                                                                                                                                   |
| <b><i>link-state-id</i></b>         | (OPTIONAL) Specify LSA ID in dotted decimal format. The LSA ID value depends on the LSA type, and it can be one of the following: <ul style="list-style-type: none"><li>the network's IP address for Type 3 LSAs or Type 5 LSAs</li><li>the router's OSPF router ID for Type 1 LSAs or Type 4 LSAs</li><li>the default destination (0.0.0.0) for Type 5 LSAs</li></ul> |
| <b><i>adv-router ip-address</i></b> | (OPTIONAL) Enter the keywords <code>adv-router</code> then the IP address of an Advertising Router to display only the LSA information about that router.                                                                                                                                                                                                              |

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                           |
|-------------|---------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.           |
| 9.4.(0.0)   | Added support for VRF.                |
| 9.0.2.0     | Introduced on the S6000.              |
| 8.3.19.0    | Introduced on the S4820T.             |
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

### Usage Information

The following describes the `show ip ospf process-id database summary` command shown in the following example.

| Item               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LS Age             | Displays the LSA age.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Options            | Displays the optional capabilities available on router. The following options can be found in this item: <ul style="list-style-type: none"> <li>• TOS-capability or No TOS-capability is displayed depending on whether the router can support Type of Service.</li> <li>• DC or No DC is displayed depending on whether the originating router can support OSPF over demand circuits.</li> <li>• E or No E is displayed on whether the originating router can accept AS External LSAs.</li> </ul> |
| LS Type            | Displays the LSA type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Link State ID      | Displays the Link State ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Advertising Router | Identifies the router ID of the LSA's originating router.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| LS Seq Number      | Displays the link state sequence number. This number allows you to identify old or duplicate LSAs.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Checksum           | Displays the Fletcher checksum of an LSA's complete contents.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Length             | Displays the length in bytes of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Network Mask       | Displays the network mask implemented on the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| TOS                | Displays the TOS options. Option 0 is the only option.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Metric             | Displays the LSA metrics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Example

```
Dell#show ip ospf 100 database summary

      OSPF Router with ID (1.1.1.10) (Process ID 100)

          Summary Network (Area 0.0.0.0)

LS age: 1551
Options: (No TOS-capability, DC, E)
LS type: Summary Network
Link State ID: 192.68.16.0
Advertising Router: 192.168.17.1
LS Seq Number: 0x80000054
Checksum: 0xb5a2
Length: 28
Network Mask: /24
      TOS: 0 Metric: 1

LS age: 9
Options: (No TOS-capability, No DC, E)
LS type: Summary Network
Link State ID: 192.68.32.0
Advertising Router: 1.1.1.10
LS Seq Number: 0x80000016
Checksum: 0x987c
Length: 28
Network Mask: /24
      TOS: 0 Metric: 1

LS age: 7
Options: (No TOS-capability, No DC, E)
LS type: Summary Network
Link State ID: 192.68.33.0
Advertising Router: 1.1.1.10

## Related Commands

[show ip ospf database](#) — displays OSPF database information.

## show ip ospf interface

Display the OSPF interfaces configured. If OSPF is not enabled on the switch, no output is generated.

### S4820T

**Syntax** `show ip ospf [process-id | vrf vrf-name] interface [interface]`

#### Parameters

- |                            |                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>process-id</i></b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. |
| <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to show the OSPF processes that are tied to a specific VRF.     |

**interface**

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                           |
|-------------|---------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.           |
| 9.4.(0.0)   | Added support for VRF.                |
| 9.2(1.0)    | Introduced on the Z9500.              |
| 9.0.2.0     | Introduced on the S6000.              |
| 8.3.19.0    | Introduced on the S4820T.             |
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

**Usage Information**

The following describes the `show ip ospf process-id interface` command shown in the following example.

| Item                 | Description                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| GigabitEthernet...   | This line identifies the interface type slot/port and the status of the OSPF protocol on that interface.                                    |
| Internet Address...  | This line displays the IP address, network mask and area assigned to this interface.                                                        |
| Process ID...        | This line displays the OSPF Process ID, Router ID, Network type and cost metric for this interface.                                         |
| Transmit Delay...    | This line displays the interface's settings for Transmit Delay, State, and Priority. In the State setting, BDR is Backup Designated Router. |
| Designated Router... | This line displays the ID of the Designated Router and its interface address.                                                               |
| Backup Designated... | This line displays the ID of the Backup Designated Router and its interface address.                                                        |
| Timer intervals...   | This line displays the interface's timer settings for Hello interval, Dead interval, Transmit Delay (Wait), and Retransmit Interval.        |
| Hello due...         | This line displays the amount time until the next Hello packet is sent out this interface.                                                  |
| Neighbor Count...    | This line displays the number of neighbors and adjacent neighbors. Listed below this line are the details about each adjacent neighbor.     |

### Example

```
Dell>show ip ospf int

TenGigabitEthernet 1/7 is up, line protocol is up
  Internet Address 192.168.1.2/30, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type
BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DR, Priority 1
  Designated Router (ID) 192.168.253.2, Interface address
192.168.1.2
  Backup Designated Router (ID) 192.168.253.1, Interface
address 192.168.1.1
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
  Hello due in 00:00:02
  Neighbor Count is 1, Adjacent neighbor count is 1
  Adjacent with neighbor 192.168.253.1 (Backup Designated
Router)

TenGigabitEthernet 1/8 is up, line protocol is up
  Internet Address 192.168.0.1/24, Area 0.0.0.1
  Process ID 1, Router ID 192.168.253.2, Network Type
BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State DROTHER, Priority 1
  Designated Router (ID) 192.168.253.5, Interface address
192.168.0.4
  Backup Designated Router (ID) 192.168.253.3, Interface
address 192.168.0.2
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
```

```

Hello due in 00:00:08
Neighbor Count is 3, Adjacent neighbor count is 2
Adjacent with neighbor 192.168.253.5 (Designated Router)
Adjacent with neighbor 192.168.253.3 (Backup Designated
Router)

Loopback 0 is up, line protocol is up
Internet Address 192.168.253.2/32, Area 0.0.0.1
Process ID 1, Router ID 192.168.253.2, Network Type
LOOPBACK, Cost: 1
Loopback interface is treated as a stub Host.
Dell>

```

## show ip ospf neighbor

Display the OSPF neighbors connected to the local router.

### S4820T

|                        |                                                                                                                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show ip ospf [<i>process-id</i>   vrf <i>vrf-name</i>] neighbor</code>                                                                                                           |
| <b>Parameters</b>      |                                                                                                                                                                                        |
|                        | <b><i>process-id</i></b> Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                            |
|                        | <b><i>vrf vrf-name</i></b> Enter the keyword <code>vrf</code> followed by the name of the VRF to show information corresponding to the OSPF neighbors that are tied to a specific VRF. |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                                         |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                         |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.           |
| 9.4.(0.0) | Added support for VRF.                |
| 9.0.2.0   | Introduced on the S6000..             |
| 8.3.19.0  | Introduced on the S4820T.             |
| 8.3.11.1  | Introduced on the Z9000.              |
| 8.3.7.0   | Introduced on the S4810.              |
| 7.8.1.0   | Added support for Multi-Process OSPF. |
| 7.6.1.0   | Introduced on the S-Series.           |
| 7.5.1.0   | Introduced on the C-Series.           |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.1.1.1 | Introduced on the E-Series. |

**Usage Information**

The following describes the `show ip ospf process-id neighbor` command shown in the following example.

| Item        | Description                                                       |
|-------------|-------------------------------------------------------------------|
| Neighbor ID | Displays the neighbor router ID.                                  |
| Pri         | Displays the priority assigned neighbor.                          |
| State       | Displays the OSPF state of the neighbor.                          |
| Dead Time   | Displays the expected time until FTOS declares the neighbor dead. |
| Address     | Displays the IP address of the neighbor.                          |
| Interface   | Displays the interface type slot/port information.                |
| Area        | Displays the neighbor's area (process ID).                        |

**Example**

```
Dell#show ip ospf 34 neighbor
```

```
Neighbor ID Pri State          Dead Time Address  Interface Area
20.20.20.7  1 FULL/DR      00:00:32 182.10.10.3 Te 1/1 0.0.0.2
192.10.10.2 1 FULL/DR      00:00:37 192.10.10.2 Te 1/2 0.0.0.1
20.20.20.1  1 FULL/DROTHER00:00:36 192.10.10.4 Te 1/3 0.0.0.1
Dell#
```

## show ip ospf routes

Display routes OSPF calculates and stores in OSPF RIB.

### S4820T

**Syntax** `show ip ospf [process-id | vrf vrf-name] routes`

**Parameters**

|                     |                                                                                                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>process-id</b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                       |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to show the OSPF RIB information corresponding to the OSPF processes that are tied to a specific VRF. |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.4(0.0) | Added support for VRF.                   |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Added support for Multi-Process OSPF.    |
| 7.6.1.0  | Introduced on the S-Series.              |
| 7.5.1.0  | Introduced on the C-Series and E-Series. |

## Usage Information

This command is useful in isolating routing problems between the OSPF and the RTM. For example, if a route is missing from the RTM/FIB but is visible from the display output of this command, the problem is with downloading the route to the RTM.

This command has the following limitations:

- The display output is sorted by prefixes; intra-area ECMP routes are not displayed together.
- For Type 2 external routes, Type 1 cost is not displayed.

**NOTE:** Starting with Version 9.4(0.0), the loopback IP address advertised to the neighbor is not displayed in the output because they are not accounted as inactive OSPF routes, whereas the loopback IP address is displayed until Dell Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the `show ip ospf routes` command displays the interface and area ID information of connected networks in addition to the other settings, whereas these details are not displayed until Dell Networking OS Version 9.3(0.0). Starting with Version 9.4(0.0), the metric of E2 routes in the output is displayed as an external metric, whereas until Dell Networking OS Version 9.3(0.0), the number of hops to the ASBR for E2 routes are displayed in the output.

## Example

```
Dell#show ip ospf 100 route
```

| Prefix        | Cost | Nexthop  | Interface | Area | Type       |
|---------------|------|----------|-----------|------|------------|
| 1.1.1.1       | 1    | 0.0.0.0  | Lo 0      | 0    | Intra-Area |
| 3.3.3.3       | 2    | 13.0.0.3 | Te 1/47   | 1    | Intra-Area |
| 13.0.0.0      | 1    | 0.0.0.0  | Te 1/47   | 0    | Intra-Area |
| 150.150.150.0 | 2    | 13.0.0.3 | Te 1/47   | -    | External   |

```
172.30.1.0      2   13.0.0.3 Te 1/47  1   Intra-Area
Dell#
```

## show ip ospf statistics

Display OSPF statistics.

### S4820T

|                        |                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.           |
| 9.4.(0.0) | Added support for VRF.                |
| 9.2(1.0)  | Introduced on the Z9500.              |
| 9.0.2.0   | Introduced on the S6000.              |
| 8.3.19.0  | Introduced on the S4820T.             |
| 8.3.11.1  | Introduced on the Z9000.              |
| 8.3.7.0   | Introduced on the S4810.              |
| 7.8.1.0   | Added support for Multi-Process OSPF. |
| 7.6.1.0   | Introduced on the S-Series.           |
| 7.5.1.0   | Introduced on the C-Series.           |
| 7.4.1.0   | Introduced on the E-Series.           |

#### Usage Information

The following describes the `show ip ospf statistics process-id global` command shown in the following example.

| Row Heading    | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Total</b>   | Displays the total number of packets the OSPF process receives/transmits.                                               |
| <b>Error</b>   | Displays the error count while receiving and transmitting packets by the OSPF process.                                  |
| <b>Hello</b>   | Number of OSPF Hello packets.                                                                                           |
| <b>DDiscr</b>  | Number of database description packets.                                                                                 |
| <b>LSReq</b>   | Number of link state request packets.                                                                                   |
| <b>LSUpd</b>   | Number of link state update packets.                                                                                    |
| <b>LSAck</b>   | Number of link state acknowledgement packets.                                                                           |
| <b>TxQ-Len</b> | The transmission queue length.                                                                                          |
| <b>RxQ-Len</b> | The reception queue length.                                                                                             |
| <b>Tx-Mark</b> | The highest number mark in the transmission queue.                                                                      |
| <b>Rx-Mark</b> | The highest number mark in the reception queue.                                                                         |
| <b>Hello-Q</b> | The queue, for transmission or reception, for the hello packets.                                                        |
| <b>LSR-Q</b>   | The queue, for transmission or reception, for the link state request packets.                                           |
| <b>Other-Q</b> | The queue, for transmission or reception, for the link state acknowledgement, database description, and update packets. |

The following describes the error definitions for the `show ip ospf statistics process-id global` command.

| Error Type          | Description                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------|
| <b>Intf_Down</b>    | Received packets on an interface that is either down or OSPF is not enabled.                        |
| <b>Non-Dr</b>       | Received packets with a destination address of ALL_DRS even though SELF is not a designated router. |
| <b>Self-Org</b>     | Receive the self originated packet.                                                                 |
| <b>Wrong_Len</b>    | The received packet length is different to what was indicated in the OSPF header.                   |
| <b>Invlid-Nbr</b>   | LSA, LSR, LSU, and DDB are received from a peer which is not a neighbor peer.                       |
| <b>Nbr-State</b>    | LSA, LSR, and LSU are received from a neighbor with stats less than the loading state.              |
| <b>Auth-Error</b>   | Simple authentication error.                                                                        |
| <b>MD5-Error</b>    | MD5 error                                                                                           |
| <b>Cksum-Err</b>    | Checksum Error                                                                                      |
| <b>Version</b>      | Version mismatch                                                                                    |
| <b>AreaMismatch</b> | Area mismatch                                                                                       |
| <b>Conf-Issue</b>   | The received hello packet has a different hello or dead interval than the configuration.            |
| <b>No-Buffer</b>    | Buffer allocation failure.                                                                          |
| <b>Seq-no</b>       | A sequence no errors occurred during the database exchange process.                                 |
| <b>Socket</b>       | Socket Read/Write operation error.                                                                  |
| <b>Q-overflow</b>   | Packets dropped due to queue overflow.                                                              |
| <b>Unknown-Pkt</b>  | Received packet is not an OSPF packet.                                                              |

### Example

```
Dell#show ip ospf 1 statistics global

OSPF Packet Count
  Total Error Hello DDiscr LSReq LSUpd LSAck
RX 10    0    8    2    0    0    0
TX 10    0   10    0    0    0    0

OSPF Global Queue Length
  TxQ-Len RxQ-Len Tx-Mark Rx-Mark
Hello-Q   0     0     0     2
LSR-Q     0     0     0     0
Other-Q   0     0     0     0

Error packets (Only for RX)
Intf-Down 0  Non-Dr   0  Self-Org 0
```

```
Wrong-Len 0   Invld-Nbr 0   Nbr-State 0
Auth-Err 0   MD5-Err 0   Chksum 0
Version 0   AreaMis 0   Conf-Issues 0
No-Buffer 0   Seq-No 0   Socket 0
Q-OverFlow 0   Unkown-Pkt 0
```

Error packets (Only for TX)

```
Socket Errors 0
Dell#
```

### Usage Information

The `show ip ospf process-id statistics` command displays the error packet count received on each interface as:

- The hello-timer remaining value for each interface
- The wait-timer remaining value for each interface
- The grace-timer remaining value for each interface
- The packet count received and transmitted for each neighbor
- Dead timer remaining value for each neighbor
- Transmit timer remaining value for each neighbor
- The LSU Q length and its highest mark for each neighbor
- The LSR Q length and its highest mark for each neighbor

### Example (Statistics)

```
Dell(conf-if-te-1/6)#do show ip ospf statistics
Interface TenGigabitEthernet 1/6
  Error packets (Receive statistics)
    Intf-Down 0 Non-Dr 0 Self-Org 0
    Wrong-Len 0 Invld-Nbr 0 Nbr-State 0
    Auth-Error 0 MD5-Error 0 Cksum-Err 0
    Version 0 AreaMisMatch 0 Conf-Issue 0
    SeqNo-Err 0 Unknown-Pkt 0 Bad-LsReq 0
    RtidZero 0
  Neighbor ID 4.4.4.4
  Packet Statistics
    Hello DDiscr LSReq LSUpd LSAck
    RX 5 2 1 3 2
    TX 6 5 1 3 3
  Timers
    Hello 0 Wait 0 Grace 0
    Dead 39 Transmit 4
  Queue Statistics
    LSU-Q-Len 0 LSU-Q-Wmark 1
    LSR-Q-Len 0 LSR-Q-Wmark 1

Dell(conf-if-te-1/6)#
```

### Related Commands

[clear ip ospf statistics](#) — clears the packet statistics in all interfaces and neighbors.

## show ip ospf timers rate-limit

Show the LSA currently in the queue waiting for timers to expire.

| <b>Command History</b>     | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                     |                          |                                                                                                                                    |                            |                                                                                                                                                                           |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.4.(0.0) | Added support for VRF.      |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.19.0  | Introduced on the S4820T.   |
| 8.3.11.1  | Introduced on the Z9000.    |
| 8.3.8.0   | Introduced on the S4810.    |

### Example

```
Dell#show ip ospf 10 timers rate-limit

List of LSAs in rate limit Queue
LSA id: 1.1.1.0 Type: 3 Adv Rtid: 3.3.3.3 Expiry time:
00:00:09.111
LSA id: 3.3.3.3 Type: 1 Adv Rtid: 3.3.3.3 Expiry time:
00:00:23.96
Dell#
```

## show ip ospf topology

Display routers in directly connected areas.

### S4820T

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                             |                          |                                                                                                                                    |                            |                                                                                                                                                                    |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>show ip ospf [process-id   vrf vrf-name] topology</code>                                                                                                                                                                                                                                                                                                                                                              |                          |                                                                                                                                    |                            |                                                                                                                                                                    |
| <b>Parameters</b>          | <table><tr><td><b><i>process-id</i></b></td><td>Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.</td></tr><tr><td><b><i>vrf vrf-name</i></b></td><td>Enter the keyword <code>vrf</code> followed by the name of the VRF to information on routers corresponding to a specific VRF that are in directly connected areas.</td></tr></table> | <b><i>process-id</i></b> | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process. | <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to information on routers corresponding to a specific VRF that are in directly connected areas. |
| <b><i>process-id</i></b>   | Enter the OSPF Process ID to show a specific process. If no Process ID is entered, command applies only to the first OSPF process.                                                                                                                                                                                                                                                                                          |                          |                                                                                                                                    |                            |                                                                                                                                                                    |
| <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to information on routers corresponding to a specific VRF that are in directly connected areas.                                                                                                                                                                                                                                                          |                          |                                                                                                                                    |                            |                                                                                                                                                                    |
| <b>Defaults</b>            | none                                                                                                                                                                                                                                                                                                                                                                                                                        |                          |                                                                                                                                    |                            |                                                                                                                                                                    |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.              |
| 9.4.(0.0) | Added support for VRF.                   |
| 9.0.2.0   | Introduced on the S6000.                 |
| 8.3.19.0  | Introduced on the S4820T.                |
| 8.3.11.1  | Introduced on the Z9000.                 |
| 8.3.7.0   | Introduced on the S4810.                 |
| 7.8.1.0   | Added support for Multi-Process OSPF.    |
| 7.6.1.0   | Introduced on the S-Series.              |
| 7.5.1.0   | Introduced on the C-Series and E-Series. |

|                          |                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To isolate problems with inter-area and external routes, use this command. In OSPF inter-area and external routes are calculated by adding LSA cost to the cost of reaching the router. If an inter-area or external route is not of correct cost, the display can determine if the path to the originating router is correct or not. |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                |                                                                                                                                          |

## summary-address

To advertise one external route, set the OSPF ASBR.

### S4820T

**Syntax** `summary-address ip-address mask [not-advertise] [tag tag-value]`  
To disable summary address, use the `no summary-address ip-address mask` command.

**Parameters**

|                             |                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>    | Specify the IP address in dotted decimal format of the address to summarize.                                                                        |
| <b><i>mask</i></b>          | Specify the mask in dotted decimal format of the address to summarize.                                                                              |
| <b><i>not-advertise</i></b> | (OPTIONAL) Enter the keywords <code>not-advertise</code> to suppress that match the network prefix/mask pair.                                       |
| <b><i>tag tag-value</i></b> | (OPTIONAL) Enter the keyword <code>tag</code> then a value to match on routes redistributed through a route map. The range is from 0 to 4294967295. |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                           |
|-------------|---------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.           |
| 9.0.2.0     | Introduced on the S6000.              |
| 8.3.19.0    | Introduced on the S4820T.             |
| 8.3.11.1    | Introduced on the Z9000.              |
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

## Usage Information

The `area range` command summarizes routes for the different areas.

With the `not-advertise` parameter configured, you can use this command to filter out some external routes. For example, if you want to redistribute static routes to OSPF, but you don't want OSPF to advertise routes with prefix 1.1.0.0, you can configure the `summary-address 1.1.0.0 255.255.0.0 not-advertise` to filter out all the routes fall in range 1.1.0.0/16.

## Related Commands

[area range](#) — summarizes routes within an area.

## timers spf

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

### S4820T

#### Syntax

```
timers spf delay holdtime
```

To return to the default, use the `no timers spf` command.

#### Parameters

|                 |                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------|
| <i>delay</i>    | Enter a number as the delay. The range is from 0 to 4294967295. The default is <b>5 seconds</b> .      |
| <i>holdtime</i> | Enter a number as the hold time. The range is from 0 to 4294967295. The default is <b>10 seconds</b> . |

#### Defaults

- delay = 5 seconds
- holdtime = 10 seconds

#### Command Modes

ROUTER OSPF

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version     | Description                           |
|-------------|---------------------------------------|
| 8.3.7.0     | Introduced on the S4810.              |
| 7.8.1.0     | Added support for Multi-Process OSPF. |
| 7.6.1.0     | Introduced on the S-Series.           |
| 7.5.1.0     | Introduced on the C-Series.           |
| pre-6.1.1.1 | Introduced on the E-Series.           |

**Usage Information** Setting the *delay* and *holdtime* parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

**Example**

```
Dell#
Dell#conf
Dell(conf)#router ospf 1
Dell(conf-router_ospf-1)#timer spf 2 5
Dell(conf-router_ospf-1)#
Dell(conf-router_ospf-1)#show config
!
router ospf 1
timers spf 2 5
Dell(conf-router_ospf-1)#
Dell(conf-router_ospf-1)#end
Dell#
Dell#
```

## timers throttle lsa all

Configure LSA transmit intervals.

### S4820T

**Syntax** `timers throttle lsa all {start-interval | hold-interval | max-interval}`

To return to the default, use the `no timers throttle lsa` command.

### Parameters

|                       |                                                                                                                                                                                              |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>start-interval</b> | Set the minimum interval between initial sending and resending the same LSA. The range is from 0 to 600,000 milliseconds.                                                                    |
| <b>hold-interval</b>  | Set the next interval to send the same LSA. This interval is the time between sending the same LSA after the start-interval has been attempted. The range is from 1 to 600,000 milliseconds. |
| <b>max-interval</b>   | Set the maximum amount of time the system waits before sending the LSA. The range is from 1 to 600,000 milliseconds.                                                                         |

### Defaults

- start-interval: **0 msec**

- hold-interval: **5000 msec**
- max-interval: **5000 msec**

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 9.0.2.0  | Introduced on the S6000..   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.8.0  | Introduced on the S4810.    |

**Usage Information** LSAs are sent after the start-interval and then after hold-interval until the maximum interval is reached. In throttling, exponential backoff is used when sending same LSA, so that the interval is multiplied until the maximum time is reached. For example, if the *start-interval 5000* and *hold-interval 1000* and *max-interval 100,000*, the LSA is sent at 5000 msec, then 1000 msec, then 2000 msec, then 4000 until 100,000 msec is reached.

## timers throttle lsa arrival

Configure the LSA acceptance intervals.

### S4820T

**Syntax** `timers throttle lsa arrival arrival-time`  
To return to the default, use the `no timers throttle lsa` command.

**Parameters** *arrival-time* Set the interval between receiving the same LSA repeatedly, to allow sufficient time for the system to accept the LSA. The range is from 0 to 600,000 milliseconds.

**Defaults** **1000 msec**

**Command Modes** ROUTER OSPF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.8.0  | Introduced on the S4810.    |

## OSPFv3 Commands

Open shortest path first version 3 (OSPFv3) for IPv6 is supported on the S4820T platform.

The fundamental mechanisms of OSPF (flooding, DR election, area support, SPF calculations, and so on) remain unchanged. However, OSPFv3 runs on a per-link basis instead of on a per-IP-subnet basis. Most changes were necessary to handle the increased address size of IPv6.

The Dell Networking implementation of OSPFv3 is based on IETF RFC 2740.

### area authentication

Configure an IPsec authentication policy for OSPFv3 packets in an OSPFv3 area.

#### S4820T

|                                |                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                  | <code>area <i>area-id</i> authentication ipsec spi <i>number</i> {MD5   SHA1} [<i>key-encryption-type</i>] <i>key</i></code>                 |
| <b>Parameters</b>              |                                                                                                                                              |
| <b><i>area area-id</i></b>     | Area for which OSPFv3 traffic is to be authenticated. For <i>area-id</i> , you can enter a number.<br><br>The range is from 0 to 4294967295. |
| <b><i>ipsec spi number</i></b> | Security Policy index (SPI) value that identifies an IPsec security policy.<br><br>The range is from 256 to 4294967295.                      |
| <b>MD5   SHA1</b>              | Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).                                                              |

**key-encryption-type** (OPTIONAL) Specifies if the key is encrypted.  
The values are 0 (key is not encrypted) or 7 (key is encrypted).

**key** Text string used in authentication.  
  
For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).  
  
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults** Not configured.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000.    |
| 8.3.19.0  | Introduced on the S4820T.             |
| 8.4.2.0   | Introduced on the E-Series TeraScale. |

**Usage Information** Before you enable IPsec authentication on an OSPFv3 area, you must first enable OSPFv3 globally on the router. Configure the same authentication policy (same SPI and key) on each interface in an OSPFv3 link.  
An SPI number must be unique to one IPsec security policy (authentication or encryption) on the router.

If you have enabled IPsec encryption in an OSPFv3 area with the `area encryption` command, you cannot use the `area authentication` command in the area at the same time.

The configuration of IPsec authentication on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area authentication policy that has been configured is applied to the interface.

To remove an IPsec authentication policy from an OSPFv3 area, enter the `no area area-id authentication spi number` command.

**Related Commands** [ipv6 ospf authentication](#) – configures an IPsec authentication policy on an OSPFv3 interface.

[show crypto ipsec policy](#) – displays the configuration of IPsec authentication policies.

## area encryption

Configure an IPsec encryption policy for OSPFv3 packets in an OSPFv3 area.

### S4820T

#### Syntax

```
area area-id encryption ipsec spi number esp encryption-  
algorithm [key-encryption-type] key authentication-algorithm  
[key-encryption-type] key
```

#### Parameters

|                                             |                                                                                                                                                                                                                                                   |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>area <i>area-id</i></b>                  | Area for which OSPFv3 traffic is to be encrypted. For <i>area-id</i> , enter a number.<br><br>The range is from 0 to 4294967295.                                                                                                                  |
| <b>ipsec spi <i>number</i></b>              | Security Policy index (SPI) value that identifies an IPsec security policy.<br><br>The range is from 256 to 4294967295.                                                                                                                           |
| <b>esp <i>encryption-<br/>algorithm</i></b> | Encryption algorithm used with ESP.<br><br>Valid values are: 3DES, DES, AES-CBC, and NULL.<br><br>For AES-CBC, only the AES-128 and AES-192 ciphers are supported.                                                                                |
| <b>key-<br/>encryption-<br/>algorithm</b>   | (OPTIONAL) Specifies if the key is encrypted.<br><br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                              |
| <b>key</b>                                  | Text string used in encryption.<br><br>The required lengths of a non-encrypted or encrypted key are:<br><br>3DES - 48 or 96 hex digits; DES - 16 or 32 hex digits; AES-CBC - 32 or 64 hex digits for AES-128 and 48 or 96 hex digits for AES-192. |
| <b>authentication-<br/>algorithm</b>        | Specifies the authentication algorithm to use for encryption.<br><br>Valid values are MD5 or SHA1.                                                                                                                                                |

|                            |                                                                                                                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>key-encryption-type</b> | (OPTIONAL) Specifies if the authentication key is encrypted.<br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                             |
| <b>key</b>                 | Text string used in authentication.<br><br>For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).<br><br>For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted). |
| <b>null</b>                | Causes an encryption policy configured for the area to not be inherited on the interface.                                                                                                                                                                   |

**Defaults** Not configured.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.    |
| <b>8.4.2.0</b>   | Introduced on the E-Series TeraScale. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.             |

**Usage Information** Before you enable IPsec encryption on an OSPFv3 interface, first enable OSPFv3 globally on the router. Configure the same encryption policy (same SPI and keys) on each interface in an OSPFv3 link.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router.

When you configure encryption for an OSPFv3 area with the `area encryption` command, you enable both IPsec encryption and authentication. However, when you enable authentication on an area with the `area authentication` command, you do not enable encryption at the same time.

If you have enabled IPsec authentication in an OSPFv3 area with the `area authentication` command, you cannot use the `area encryption` command in the area at the same time.

The configuration of IPsec encryption on an interface-level takes precedence over an area-level configuration. If you remove an interface configuration, an area encryption policy that has been configured is applied to the interface.

To remove an IPsec encryption policy from an interface, enter the `no area area-id encryption spi number` command.

**Related  
Commands**

[ipv6 ospf encryption](#) – configures an IPsec encryption policy on an OSPFv3 interface.

[show crypto ipsec policy](#) – display the configuration of IPsec encryption policies.

## clear ipv6 ospf process

Reset an OSPFv3 router process without removing or re-configuring the process.

### S4820T

**Syntax**

```
clear ipv6 ospf [vrf vrf-name] process
```

**Parameters**

**vrf *vrf-name*** (Optional) Enter the keyword `vrf` followed by the name of the VRF to clear IPv6 routes corresponding to that VRF.

**Command  
Modes**

- EXEC
- EXEC Privilege

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.7(0.0)  | Added support for VRF.             |
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 7.8.1.0   | Added support for C-Series.        |
| 7.4.1.0   | Introduced on the E-Series.        |

## debug ipv6 ospf bfd

Display debug information and interface types for bidirectional forwarding detection (BFD) on OSPF IPv6 packets.

### S4820T

**Syntax** [no] debug ipv6 ospf bfd [*interface*]

**Parameters**

***interface*** (OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                 |
|-----------|---------------------------------------------|
| 9.2(1.0)  | Introduced on the Z9500.                    |
| 9.2.(0.0) | Introduced on the S4820T, S4810, and Z9000. |

**Usage Information** The following section describes the command fields.

| Lines Beginning With or Including | Description                                                |
|-----------------------------------|------------------------------------------------------------|
| OSPFv3...                         | Debugging is on for all OSPFv3 packets and all interfaces. |
| 05:21:01                          | Displays the time stamp.                                   |
| Sending Ver:3                     | Sending OSPF3 version..                                    |

**Example**

```
Dell(conf-if-te-1/2)#do debug ipv6 ospf bfd te 1/2
OSPFv3 bfd related debugging is on for TenGigabitEthernet 1/2
00:59:26 : OSPFv3INFO: Received Interface mode bfd config
command on interface Te 1/2 Enable 1, interval 0, min_rx 0,
Multiplier 0, role 0, Disable 0
00:59:26 : OSPFv3INFO: Enabling BFD on interface Te 1/2 Cmd
Add Session
```

```

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                        |
|----------|------------------------------------|
| 9.2(1.0) | Introduced on the Z9500.           |
| 9.1(0.0) | Introduced on the S4810 and Z9000. |
| 8.3.19.0 | Introduced on the S4820T.          |
| 7.8.1.0  | Added support for C-Series.        |
| 7.4.1.0  | Introduced on E-Series.            |

### Example

```
Dell#debug ipv6 ospf packet
OSPFv3 packet related debugging is on for all interfaces
05:21:01 : OSPFv3: Sending, Ver:3, Type:1(Hello), Len:40,
Router
ID:223.255.255.254, Area ID:0, Inst:0, on Po 255
05:21:03 : OSPFv3: Received, Ver:3, Type:1(Hello), Len:40,
Router
ID:223.255.255.255, Area ID:0, Chksum:a177, Inst:0, from V1 100
05:20:25 : OSPFv3: Sending, Ver:3, Type:4(LS Update), Len:580,
Router
ID:223.255.255.254, Area ID:0, Inst:0, on V1 1000
07:21:40 : OSPFv3: Received, Ver:3, Type:1(Hello), Len:40,
Router ID:223.255.255.254, Area ID:0, Chksum:af8f, Inst:0,
from Te 1/6
Dell#
```

| type:                             | Displays the type of packet sent: <ul style="list-style-type: none"> <li>• 1 - Hello packet</li> <li>• 2 - database description</li> <li>• 3 - link state request</li> <li>• 4 - link state update</li> <li>• 5 - link state acknowledgement</li> <li>• 7 - external LSA</li> <li>• 8 - link-state advertisement (OSPFv3)</li> <li>• 9 - link local LSA (OSPFv2), Intra-Area-Prefix LSA (OSPFv3)</li> <li>• 11 - grace LSA (OSPFv3)</li> </ul> |
| Length:                           | Displays the packet length.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Router ID:                        | Displays the OSPF3 router ID.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Area ID:                          | Displays the Area ID.                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Lines Beginning With or Including | Description                  |
|-----------------------------------|------------------------------|
| Chksum:                           | Displays the OSPF3 checksum. |

## default-information originate

Configure the Dell Networking OS to generate a default external route into an OSPFv3 routing domain.

### S4820T

**Syntax**

```
default-information originate [always] [metric metric-value]
[metric-type type-value] [route-map map-name]
```

To return to the default values, use the `no default-information originate` command.

### Parameters

|                                      |                                                                                                                                                                                                                                                        |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                        | (OPTIONAL) Enter the keyword <code>always</code> to specify that default route information must always be advertised.                                                                                                                                  |
| <b>metric <i>metric-value</i></b>    | (OPTIONAL) Enter the keyword <code>metric</code> then a number to configure a metric value for the route. The range is from 1 to 16777214.                                                                                                             |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then an OSPFv3 link state type of 1 or 2 for default routes. The values are: <ul style="list-style-type: none"> <li>• 1 = Type 1 external route</li> <li>• 2 = Type 2 external route</li> </ul> |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map.                                                                                                                                                        |

**Defaults** Disabled.

**Command Modes** ROUTER OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 7.8.1.0   | Added support for C-Series.        |
| 7.4.1.0   | Introduced on the E-Series.        |

**Related Commands**      [redistribute](#) — redistributes routes from other routing protocols into OSPFv3.

## graceful-restart grace-period

Enable OSPFv3 graceful restart globally by setting the grace period (in seconds) that an OSPFv3 router's neighbors continues to advertise the router as adjacent during a graceful restart.

### S4820T

**Syntax**                      `graceful-restart grace-period seconds`  
To disable OSPFv3 graceful restart, enter `no graceful-restart grace-period`.

**Parameters**                      **seconds**                      Time duration, in seconds, that specifies the duration of the restart process before OSPFv3 terminates the process. The range is from 40 to 1800 seconds.

**Defaults**                      OSPFv3 graceful restart is disabled and functions in a helper-only role.

**Command Modes**                      ROUTER OSPFv3

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000.    |
| 8.4.2.2   | Introduced on the E-Series TeraScale. |
| 8.3.19.0  | Introduced on the S4820T.             |

**Usage Information**                      By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

To enable OSPFv3 graceful restart, enter the `ipv6 router ospf` command to enter OSPFv3 configuration mode and then configure a grace period using the `graceful-restart grace-period` command. The grace period is the length of time that OSPFv3 neighbors continue to advertise the restarting router as though it is fully adjacent. When graceful restart is enabled (restarting role), an OSPFv3 restarting expects its OSPFv3 neighbors to help when it restarts by not advertising the broken link.

When you enable the helper-reject role on an interface with the `ipv6 ospf graceful-restart helper-reject` command, you reconfigure OSPFv3 graceful restart to

function in a "restarting-only" role. In a "restarting-only" role, OSPFv3 does not participate in the graceful restart of a neighbor.

## graceful-restart mode

Specify the type of events that trigger an OSPFv3 graceful restart.

### S4820T

#### Syntax

```
graceful-restart mode {planned-only | unplanned-only}
```

To disable graceful restart mode, enter `no graceful-restart mode`.

#### Parameters

- |                       |                                                                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>planned-only</b>   | (OPTIONAL) Enter the keywords <code>planned-only</code> to indicate graceful restart is supported in a planned restart condition only.      |
| <b>unplanned-only</b> | (OPTIONAL) Enter the keywords <code>unplanned-only</code> to indicate graceful restart is supported in an unplanned restart condition only. |

#### Defaults

OSPFv3 graceful restart supports both planned and unplanned failures.

#### Command Modes

ROUTER OSPFv3

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.    |
| <b>8.4.2.2</b>   | Introduced on the E-Series TeraScale. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.             |

#### Usage Information

OSPFv3 graceful restart supports planned-only and/or unplanned-only restarts. The default is support for both planned and unplanned restarts.

- A planned restart occurs when you enter the `redundancy force-failover rpm` command to force the primary RPM to switch to the backup RPM. During a planned restart, OSPF sends out a Type-11 Grace LSA before the system switches over to the backup RPM.
- An unplanned restart occurs when an unplanned event causes the active RPM to switch to the backup RPM, such as when an active process crashes, the active RPM is removed, or a power failure happens. During an unplanned restart, OSPF sends out a Grace LSA when the backup RPM comes online.

By default, both planned and unplanned restarts trigger an OSPFv3 graceful restart. Selecting one or the other mode restricts OSPFv3 to the single selected mode.

## ipv6 ospf area

Enable IPv6 OSPF on an interface.

### S4820T

**Syntax** `ipv6 ospf process id area area id`  
To disable OSPFv6 routing for an interface, use the `no ipv6 ospf process-id area area-id` command.

**Parameters**

|                     |                                                      |
|---------------------|------------------------------------------------------|
| <i>process-id</i>   | Enter the process identification number.             |
| <i>area area-id</i> | Specify the OSPF area. The range is from 0 to 65535. |

**Defaults** none

**Command Modes** INTERFACE

**Command History**

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000.       |
| 8.3.19.0  | Introduced on the S4820T.                |
| 7.4.1.0   | Introduced on the E-Series and C-Series. |

## ipv6 ospf authentication

Configure an IPsec authentication policy for OSPFv3 packets on an IPv6 interface.

### S4820T

**Syntax** `ipv6 ospf authentication {null | ipsec spi number {MD5 | SHA1} [key-encryption-type] key}`

**Parameters**

|                         |                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>null</b>             | Causes an authentication policy configured for the area to not be inherited on the interface.                    |
| <b>ipsec spi number</b> | Security Policy index (SPI) value that identifies an IPsec security policy. The range is from 256 to 4294967295. |
| <b>MD5   SHA1</b>       | Authentication type: Message Digest 5 (MD5) or Secure Hash Algorithm 1 (SHA-1).                                  |

**key-encryption-type** (OPTIONAL) Specifies if the key is encrypted.  
Valid values: 0 (key is not encrypted) or 7 (key is encrypted).

**key** Text string used in authentication.  
  
For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).  
  
For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                    |
|-----------|--------------------------------|
| 9.1.(0.0) | Introduced on S4810 and Z9000. |
| 8.4.2.0   | Introduced on the E-Series.    |
| 8.3.19.0  | Introduced on the S4820T.      |

**Usage Information** Before you enable IPsec authentication on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same authentication policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec authentication policy from an interface, enter the `no ipv6 ospf authentication spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the `no ipv6 ospf authentication null` command.

**Related Commands** [area authentication](#) – configures an IPsec authentication policy for an OSPFv3 area.

[show crypto ipsec policy](#) – displays the configuration of IPsec authentication policies.

[show crypto ipsec sa ipv6](#) – displays the security associations set up for OSPFv3 interfaces in authentication policies.

## ipv6 ospf bfd all-neighbors

Establish BFD sessions with all OSPFv3 neighbors on a single interface or use non-default BFD session parameters.

### S4820T

#### Syntax

```
ipv6 ospf bfd all-neighbors [disable | [interval interval  
min_rx min_rx multiplier value role {active | passive}]]
```

To disable all BFD sessions on an OSPFv3 interface implicitly, use the `no ipv6 ospf bfd all-neighbors disable` command in interface mode..

#### Parameters

|                                         |                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>disable</b>                          | (OPTIONAL) Enter the keyword <code>disable</code> to disable BFD on this interface.                                                                                                                                                                                                                                                                                                                      |
| <b>interval<br/><i>milliseconds</i></b> | (OPTIONAL) Enter the keyword <code>interval</code> to specify non-default BFD session parameters beginning with the transmission interval. The range is from 50 to 1000. The default is <b>100</b> .                                                                                                                                                                                                     |
| <b>min_rx<br/><i>milliseconds</i></b>   | Enter the keywords <code>min_rx</code> to specify the minimum rate at which the local system receives control packets from the remote system. The range is from 50 to 100. The default is <b>100</b> .                                                                                                                                                                                                   |
| <b>multiplier <i>value</i></b>          | Enter the keyword <code>multiplier</code> to specify the number of packets that must be missed in order to declare a session down. The range is from 3 to 50. The default is <b>3</b> .                                                                                                                                                                                                                  |
| <b>role [active  <br/>passive]</b>      | Enter the role that the local system assumes: <ul style="list-style-type: none"><li>• <b>Active</b> — The active system initiates the BFD session. Both systems can be active for the same session.</li><li>• <b>Passive</b> — The passive system does not initiate a session. It only responds to a request for session initialization from the active system.</li></ul> The default is <b>Active</b> . |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version | Description                                 |
|---------|---------------------------------------------|
| 9.2.0.0 | Introduced on the Z9000, S4820T, and S4810. |

### Usage Information

This command provides the flexibility to fine-tune the timer values based on individual interface needs when you configure `ipv6 ospf bfd` in CONFIGURATION mode. Any timer values specified with this command overrides timers set using the `bfd all-neighbors` command. Using the `no` form of this command does not disable BFD if you configure BFD in CONFIGURATION mode.

To disable BFD on a specific interface while you configure BFD in CONFIGURATION mode, use the keyword `disable`.

## ipv6 ospf cost

Explicitly specify the cost of sending a packet on an interface.

### S4820T

**Syntax** `ipv6 ospf interface-cost`

**Parameters** `interface-cost` Enter a unsigned integer value expressed as the link-state metric. The range is from 1 to 65535.

**Defaults** Default cost based on the bandwidth.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 7.8.1.0   | Added support for C-Series.        |
| 7.4.1.0   | Introduced on the E-Series.        |
| 8.3.19.0  | Introduced on the S4820T.          |

### Usage Information

In general, the path cost is calculated as:

$10^8 / \text{bandwidth}$

Using this formula, the default path cost is calculated as:

- GigabitEthernet—Default cost is 1

- TenGigabitEthernet—Default cost is 1
- FortygigEthernet — Default cost is 1
- Ethernet—Default cost is 10

## ipv6 ospf dead-interval

Set the time interval since the last hello-packet was received from a router. After the time interval elapses, the neighboring routers declare the router down.

### S4820T

**Syntax** `ipv6 ospf dead-interval seconds`  
 To return to the default time interval, use the `no ipv6 ospf dead-interval` command.

**Parameters** `seconds` Enter the time interval in seconds. The range is from 1 to 65535 seconds.

**Defaults** 40 seconds (Ethernet).

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 7.8.1.0   | Added support for C-Series.        |
| 7.4.1.0   | Introduced on the E-Series.        |
| 8.3.19.0  | Introduced on the S4820T.          |

**Usage Information** By default, the dead interval is four times longer than the default hello-interval.

**Related Commands** [ipv6 ospf hello-interval](#) – specifies the time interval between hello packets.

## ipv6 ospf encryption

Configure an IPsec encryption policy for OSPFv3 packets on an IPv6 interface.

### S4820T

|                   | <b>key-encryption-type</b>                                                                                                                                                | (OPTIONAL) Specifies if the authentication key is encrypted.<br><br>Valid values: 0 (key is not encrypted) or 7 (key is encrypted).                                                                                                                   |
|                   | <b>key</b>                                                                                                                                                                | Text string used in authentication.<br><br>For MD5 authentication, the key must be 32 hex digits (non-encrypted) or 64 hex digits (encrypted).                                                                                                        |

For SHA-1 authentication, the key must be 40 hex digits (non-encrypted) or 80 hex digits (encrypted).

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000.    |
| 8.4.2.0   | Introduced on the E-Series TeraScale. |
| 8.3.19.0  | Introduced on the S4820T.             |

**Usage Information**

Before you enable IPsec encryption on an OSPFv3 interface, first enable IPv6 unicast routing globally, configure an IPv6 address and enable OSPFv3 on the interface, and assign the interface to an area.

An SPI value must be unique to one IPsec security policy (authentication or encryption) on the router. Configure the same encryption policy (same SPI and key) on each OSPFv3 interface in a link.

To remove an IPsec encryption policy from an interface, enter the `no ipv6 ospf encryption spi number` command. To remove null authentication on an interface to allow the interface to inherit the authentication policy configured for the OSPFv3 area, enter the `no ipv6 ospf no ipv6 ospf encryption null` command.

**Related Commands**

[area encryption](#) – configures an IPsec encryption policy for an OSPFv3 area.

[show crypto ipsec policy](#) – displays the configuration of IPsec encryption policies.

[show crypto ipsec sa ipv6](#) – displays the security associations set up for OSPFv3 interfaces in encryption policies.

## ipv6 ospf graceful-restart helper-reject

Configure an OSPFv3 interface to not act upon the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

### S4820T

**Syntax** `ipv6 ospf graceful-restart helper-reject`

To disable the helper-reject role, enter `no ipv6 ospf graceful-restart helper-reject`.

**Defaults** The helper-reject role is not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.4.2.2   | Introduced on E-Series TeraScale.  |
| 8.3.19.0  | Introduced on the S4820T.          |

**Usage Information** By default, OSPFv3 graceful restart is disabled and functions only in a helper role to help restarting neighbor routers in their graceful restarts when it receives a Grace LSA.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

The graceful-restart role command is not supported in OSPFv3. When you enable the helper-reject role on an interface, you reconfigure an OSPFv3 router to function in a "restarting-only" role.

## ipv6 ospf hello-interval

Specify the time interval between the hello packets sent on the interface.

### S4820T

**Syntax** `ipv6 ospf hello-interval seconds`  
To return to the default time interval, enter `no ipv6 ospf hello-interval`.

**Parameters** **seconds** Enter the time interval in seconds as the time between hello packets. The range is from 1 to 65525 seconds.

**Defaults** 10 seconds (Ethernet).

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 7.8.1.0   | Added support for the C-Series.    |
| 7.4.1.0   | Introduced on the E-Series.        |
| 8.3.19.0  | Introduced on the S4820T.          |

## Usage Information

The time interval between hello packets must be the same for routers in a network.

## Related Commands

[ipv6 ospf dead-interval](#) – specifies the time interval between hello packets was received from a router.

## ipv6 ospf priority

To determine the Designated Router for the OSPFv3 network, set the priority of the interface.

### S4820T

#### Syntax

```
ipv6 ospf priority number
```

To return to the default time interval, use the `no ipv6 ospf priority` command.

#### Parameters

***number*** Enter the number as the priority. The range is from 1 to 255.

#### Defaults

1

#### Command Modes

INTERFACE

#### Command History

| Version   | Description                        |
|-----------|------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 7.8.1.0   | Added support for the C-Series.    |
| 7.4.1.0   | Introduced on the E-Series.        |

## Usage Information

Setting a priority of 0 makes the router ineligible for election as a Designated Router or Backup Designated Router.

Use this command for interfaces connected to multi-access networks, not point-to-point networks.

## ipv6 router ospf

Enable OSPF for IPv6 router configuration.

### S4820T

The range is from 1 to 65535.                                                                                                                                                                                                                                         |                          |                                                                        |                            |                                                                                                                   |
| <b><i>vrf vrf-name</i></b> | (Optional) Enter the keyword <code>vrf</code> followed by the name of the VRF to install IPv6 routes in that VRF.                                                                                                                                                                                              |                          |                                                                        |                            |                                                                                                                   |
| <b>Defaults</b>            | none                                                                                                                                                                                                                                                                                                           |                          |                                                                        |                            |                                                                                                                   |
| <b>Command Modes</b>       | CONFIGURATION                                                                                                                                                                                                                                                                                                  |                          |                                                                        |                            |                                                                                                                   |
| <b>Command History</b>     | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                                                                                                 |                          |                                                                        |                            |                                                                                                                   |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                        |
|-----------|------------------------------------|
| 9.7(0.0)  | Added support for VRF.             |
| 9.2(1.0)  | Introduced on the Z9500.           |
| 9.1.(0.0) | Introduced on the S4810 and Z9000. |
| 8.3.19.0  | Introduced on the S4820T.          |
| 7.8.1.0   | Added support for the C-Series.    |
| 7.4.1.0   | Introduced on the E-Series.        |

## maximum-paths

Enable the software to forward packets over multiple paths.

### S4820T

|               |                                   |
|---------------|-----------------------------------|
| <b>Syntax</b> | <code>maximum-paths number</code> |
|---------------|-----------------------------------|

To disable packet forwarding over multiple paths, use the `no maximum-paths` command.

|                        |                      |                                                                                        |
|------------------------|----------------------|----------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b><i>number</i></b> | Specify the number of paths. The range is from 1 to 64. The default is <b>8</b> paths. |
| <b>Defaults</b>        | 8                    |                                                                                        |
| <b>Command Modes</b>   | ROUTER OSPF          |                                                                                        |
| <b>Command History</b> | <b>Version</b>       | <b>Description</b>                                                                     |
|                        | 8.3.19.0             | Introduced on the S4820T.                                                              |
|                        | 8.3.11.1             | Introduced on the Z9000.                                                               |
|                        | 8.3.7.0              | Introduced on the S4810.                                                               |
|                        | 7.8.1.0              | Added support for Multi-Process OSPF.                                                  |
|                        | 7.6.1.0              | Introduced on the S-Series.                                                            |
|                        | 7.5.1.0              | Introduced on the C-Series.                                                            |
|                        | pre-6.1.1.1          | Introduced on the E-Series.                                                            |

## passive-interface

Disable (suppress) sending routing updates on an interface.

### S4820T

**Syntax** `passive-interface interface`  
To enable sending routing updates on an interface, use the `no passive-interface interface` command.

**Parameters** ***interface*** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Enabled, that is sending of routing updates are enabled by default.

**Command Modes**

ROUTER OSPF for OSPFv2

ROUTER OSPFv3 for OSPFv3

**Command History**

| Version  | Description                                           |
|----------|-------------------------------------------------------|
| 9.2(1.0) | Introduced on the Z9500.                              |
| 9.1(0.0) | Introduced support for OSPFv3 on the S4810 and Z9000. |
| 8.3.19.0 | Introduced on the S4820T.                             |
| 7.8.1.0  | Added support for the C-Series.                       |
| 7.4.1.0  | Introduced on the E-Series.                           |

**Usage Information**

By default, no interfaces are *passive*. Routing updates are sent to all interfaces on which the routing protocol is enabled.

If you disable the sending of routing updates on an interface, the particular address prefix continues to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

OSPFv3 for IPv6 routing information is not sent or received through the specified router interface. The specified interface address appears as a stub network in the OSPFv3 for IPv6 domain.

On configuring suppression using the `passive-interface` command, the state of the OSPF neighbor does not change to INIT; instead, the state of the OSPF neighbor changes to DOWN after the dead-timer expires.

**redistribute**

Redistribute into OSPFv3.

**S4820T****Syntax**

```
redistribute {bgp as number}{connected | static}[metric metric-value | metric-type type-value] [route-map map-name] [tag tag-value]
```

To disable redistribution, use the `no redistribute {connected | static}` command.

**Parameters**

***bgp as number*** Enter the keyword `bgp` then the autonomous system number.

The range is from 1 to 65535.

|                                      |                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b>                     | Enter the keyword <code>connected</code> to redistribute routes from physically connected interfaces.                                                                                                                                                                                            |
| <b>static</b>                        | Enter the keyword <code>static</code> to redistribute manually configured routes.                                                                                                                                                                                                                |
| <b>metric <i>metric-value</i></b>    | Enter the keyword <code>metric</code> then the metric value.<br><br>The range is from 0 to 16777214.<br><br>The default is <b>20</b> .                                                                                                                                                           |
| <b>metric-type <i>type-value</i></b> | (OPTIONAL) Enter the keywords <code>metric-type</code> then the OSPFv3 link state type of 1 or 2 for default routes. The values are:<br><br><ul style="list-style-type: none"> <li>• 1 for a type 1 external route</li> <li>• 2 for a type 2 external route</li> </ul> The default is <b>2</b> . |
| <b>route-map <i>map-name</i></b>     | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of an established route map. If the route map is not configured, the default is <b>deny</b> (to drop all routes).                                                                                                             |
| <b>tag <i>tag-value</i></b>          | (OPTIONAL) Enter the keyword <code>tag</code> to set the tag for routes redistributed into OSPFv3.<br><br>The range is from 0 to 4294967295<br><br>The default is <b>0</b> .                                                                                                                     |

**Defaults** Not configured.

**Command Modes** ROUTER OSPF for OSPFv2  
ROUTER OSPFv3 for OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version          | Description                                           |
|------------------|-------------------------------------------------------|
| <b>9.1.(0.0)</b> | Introduced support for OSPFv3 on the S4810 and Z9000. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.                             |

| Version | Description                     |
|---------|---------------------------------|
| 7.8.1.0 | Added support for the C-Series. |
| 7.4.1.0 | Introduced on the E-Series.     |

**Usage Information** To redistribute the default route (x:x:x::x), use the `default-information originate` command.

**Related Commands** [default-information originate](#) – configures default external route into OSPFv3.

## router-id

Designate a fixed router ID.

### S4820T

**Syntax** `router-id ip-address`  
 To return to the previous router ID, use the `no router-id ip-address` command.

**Parameters** *ip-address* Enter the router ID in the dotted decimal format.

**Defaults** The router ID is selected automatically from the set of IPv4 addresses configured on a router.

**Command Modes** ROUTER OSPF for OSPFv2  
 ROUTER OSPFv3 for OSPFv3

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                           |
|-----------|-------------------------------------------------------|
| 9.1.(0.0) | Introduced support for OSPFv3 on the S4810 and Z9000. |
| 8.3.19.0  | Introduced on the S4820T.                             |
| 7.8.1.0   | Added support for the C-Series.                       |
| 7.4.1.0   | Introduced on the E-Series.                           |

**Usage Information** You can configure an arbitrary value in the IP address for each router. However, each router ID must be unique.

If this command is used on an OSPFv3 process that is already active (has neighbors), all the neighbor adjacencies are brought down immediately and new sessions are initiated with the new router ID.

**Related Commands**      [clear ipv6 ospf process](#) – resets an OSPFv3 router process.

## show crypto ipsec policy

Display the configuration of IPsec authentication and encryption policies.

### S4820T

|                      |                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <b>show crypto ipsec policy</b> [ <i>name name</i> ]                                        |
| <b>Parameters</b>    | <b>name <i>name</i></b> (OPTIONAL) Displays configuration details about a specified policy. |
| <b>Defaults</b>      | No default behavior or values.                                                              |
| <b>Command Modes</b> | EXEC<br>EXEC Privilege                                                                      |

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.1.(0.0) | Introduced on the S4810 and Z9000.    |
| 8.4.2.0   | Introduced on the E-Series TeraScale. |
| 8.3.19.0  | Introduced on the S4820T.             |

**Usage Information**      The `show crypto ipsec policy` command output displays the AH and ESP parameters configured in IPsec security policies, including the SPI number, keys, and algorithms used.

When configured in a helper-reject role, an OSPFv3 router ignores the Grace LSAs that it receives from a restarting OSPFv3 neighbor.

**Related Commands**      [show crypto ipsec sa ipv6](#) – displays the IPsec security associations used on OSPFv3 interfaces.

**Example**

```
Dell#show crypto ipsec policy
Crypto IPsec client security policy data
```

```

Policy name : OSPFv3-1-502
Policy refcount : 1
Inbound ESP SPI : 502 (0x1F6)
Outbound ESP SPI : 502 (0x1F6)
Inbound ESP Auth Key : 123456789a123456789b123456789c12

### show crypto ipsec policy Command Fields

| Field                   | Description                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------|
| Policy name             | Displays the name of an IPsec policy.                                                                |
| Policy refcount         | Number of interfaces on the router that use the policy.                                              |
| Inbound ESP SPI         | The encapsulating security payload (ESP) security policy index (SPI) for inbound and outbound links. |
| Outbound ESP SPI        |                                                                                                      |
| Inbound ESP Auth Key    | The ESP authentication key for inbound and outbound links.                                           |
| Outbound ESP Auth Key   |                                                                                                      |
| Inbound ESP Cipher Key  | The ESP encryption key for inbound and outbound links.                                               |
| Outbound ESP Cipher Key |                                                                                                      |
| Transform set           | The set of security protocols and algorithms used in the policy.                                     |

|                 |                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------|
| Inbound AH SPI  | The authentication header (AH) security policy index (SPI) for inbound and outbound links. |
| Outbound AH SPI |                                                                                            |
| Inbound AH Key  | The AH key for inbound and outbound links.                                                 |
| Outbound AH Key |                                                                                            |

## show crypto ipsec sa ipv6

Display the IPsec security associations (SAs) used on OSPFv3 interfaces.

### S4820T

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show crypto ipsec sa ipv6 [interface <i>interface</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>      | <p><b>interface</b><br/><b><i>interface</i></b> (OPTIONAL) Displays information about the SAs used on a specified OSPFv3 interface, where <i>interface</i> is one of the following values:</p> <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>Defaults</b>        | No default behavior or values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Command Modes</b>   | EXEC<br>EXEC Privilege                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Version          | Description                           |
|------------------|---------------------------------------|
| <b>9.1.(0.0)</b> | Introduced on the S4810 and Z9000.    |
| <b>8.4.2.0</b>   | Introduced on the E-Series TeraScale. |
| <b>8.3.19.0</b>  | Introduced on the S4820T.             |

**Usage Information**

The `show crypto ipsec sa ipv6` command output displays security associations set up for OSPFv3 links in IPsec authentication and encryption policies on the router.

**Related Commands**

[show crypto ipsec policy](#) – displays the configuration of IPsec authentication and encryption policies.

**Example**

```
Dell#show crypto ipsec policy
Dell#show crypto ipsec sa ipv6

Interface: TenGigabitEthernet 1/1
Link Local address: fe80::201:e8ff:fe40:4d10
IPSecv6 policy name: OSPFv3-1-500

inbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

outbound ah sas
spi : 500 (0x1f4)
transform : ah-md5-hmac
in use settings : {Transport, }
replay detection support : N
STATUS : ACTIVE

inbound esp sas

outbound esp sas

Interface: TenGigabitEthernet 1/2
Link Local address: fe80::201:e8ff:fe40:4d11

## show ipv6 ospf interface

View OSPFv3 interface information.

### S4820T

**Syntax** `show ipv6 ospf [process-number] [vrf vrf-name] [interface]`

#### Parameters

***process-number*** Enter the OSPF process number.

***vrf vrf-name*** (OPTIONAL) Enter the keyword vrf followed by the name of the VRF to display neighbors corresponding to that VRF.

**NOTE:** If you do not specify this option, neighbors corresponding to the default VRF are displayed.

**interface**

(OPTIONAL) Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** none

**Command Modes** EXEC

**Command History**

| Version   | Description                                                           |
|-----------|-----------------------------------------------------------------------|
| 9.7(0.0)  | Added support for VRF.                                                |
| 9.2(1.0)  | Introduced on the Z9500.                                              |
| 9.2.(0.0) | Added support for showing BFD status on the S4820T, S4810, and Z9000. |
| 9.1.(0.0) | Added support for OSPFv3 on the S4810 and Z9000.                      |
| 8.3.19.0  | Introduced on the S4820T.                                             |
| 7.8.1.0   | Added support for the C-Series.                                       |
| 7.4.1.0   | Introduced on the E-Series.                                           |

**Usage Information**

If you enable BFD at the global level, `show ipv6 ospf interface` shows the BFD provisioning.

If you enable BFD at the interface level, `show ipv6 ospf interface` shows the BFD interval timers.

**Example**

```
Dell#show ipv6 ospf 3 interface tengigabitethernet 1/2
TenGigabitEthernet 1/2 is up, line protocol is up
  Link Local Address fe80::201:e8ff:fe17:5bbd, Interface ID
  67420217
  Area 0, Process ID 1, Instance ID 0, Router ID 11.1.1.1
  NetworkType BROADCAST, Cost: 1, Passive: No
  Transmit Delay is 100 sec, State DR, Priority 1
  Interface is using OSPF global mode BFD configuration.
  Designated router on this network is 11.1.1.1 (local)
  No backup designated router on this network
  Timer intervals configured, Hello 10, Dead 40, Wait 1,
  Retransmit 5
```

Dell#

## show ipv6 ospf neighbor

Display the OSPF neighbor information on a per-interface basis.

| Version | Description                 |
|---------|-----------------------------|
| 7.4.1.0 | Introduced on the E-Series. |

#### Example

```
Dell#show ipv6 ospf 3 neighbor gi 1/2

Neighbor ID Pri State Dead Time Interface ID
Interface
63.114.8.36 1 FULL/DR 00:00:38 4 Te
1/2

Dell#
```

## timers spf

Set the time interval between when the switch receives a topology change and starts a shortest path first (SPF) calculation.

### S4820T

#### Syntax

```
timers spf delay holdtime
```

To return to the default, use the `no timers spf` command.

#### Parameters

|                 |                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------|
| <b>delay</b>    | Enter a number as the delay. The range is from 0 to 4294967295. The default is <b>5 seconds</b> .      |
| <b>holdtime</b> | Enter a number as the hold time. The range is from 0 to 4294967295. The default is <b>10 seconds</b> . |

#### Defaults

- delay = 5 seconds
- holdtime = 10 seconds

#### Command Modes

ROUTER OSPFv3 for OSPFv3

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                              |
|----------|----------------------------------------------------------|
| 9.8(0.0) | Introduced on the S6000-ON, S6000, S4820T, S4810, S5000. |

#### Usage Information

Setting the *delay* and *holdtime* parameters to a low number enables the switch to an alternate path quickly but requires more CPU usage.

#### Example

```
Dell#conf
Dell(conf)#ipv6 router ospf 1
Dell(conf-ipv6-router_ospf)#timer spf 2 5
```

```
Dell(conf-ipv6-router_ospf)#  
Dell(conf-ipv6-router_ospf)#show config  
!  
ipv6 router ospf 1  
timers spf 2 5  
Dell(conf-ipv6-router_ospf)#  
Dell(conf-ipv6-router_ospf)#end  
Dell#
```

## Policy-based Routing (PBR)

Policy-based routing (PBR) allows you to apply routing policies to specific interfaces. To enable PBR, create a redirect list and apply it to the interface. After the redirect list is applied to the interface, all traffic passing through the interface is subject to the rules defined in the redirect list. PBR is supported by the Dell Networking Operating System (OS).

You can apply PBR to physical interfaces and logical interfaces (such as a link aggregation group [LAG] or virtual local area network [VLAN]). Trace lists and redirect lists do not function correctly when you configure both in the same configuration.

 **NOTE:** Apply PBR to Layer 3 interfaces only.

 **NOTE:** For more information, refer to [Content Addressable Memory \(CAM\)](#) chapter.

### description

Add a description to this redirect list.

#### S4820T

|                        |                                                                                       |                                                                               |
|------------------------|---------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>description {description}</code>                                                |                                                                               |
|                        | To remove the description, use the <code>no description {description}</code> command. |                                                                               |
| <b>Parameters</b>      | <b><i>description</i></b>                                                             | Enter a description to identify the IP redirect list (16 characters maximum). |
| <b>Defaults</b>        | none                                                                                  |                                                                               |
| <b>Command Modes</b>   | REDIRECT-LIST                                                                         |                                                                               |
| <b>Command History</b> | <b>Version</b>                                                                        | <b>Description</b>                                                            |
|                        | 9.7(0.0)                                                                              | Introduced on the S6000-ON.                                                   |
|                        | 9.4(0.0)                                                                              | Introduced on the S4810, S4820T, S6000, and Z9000.                            |
|                        | 8.4.2.1                                                                               | Introduced on the C-Series and S-Series.                                      |

| Version | Description                            |
|---------|----------------------------------------|
| 8.4.2.0 | Introduced on the E-Series Tera Scale. |
| 7.7.1.0 | Introduced on the E-Series ExaScale.   |

**Related Commands**      [ip redirect-list](#) – enables an IP Redirect List.

## ip redirect-group

Apply a redirect list (policy-based routing) on an interface. You can apply multiple redirect lists to an interface by entering this command multiple times.

### S4820T

**Syntax**                    `ip redirect-group redirect-list-name`  
 To remove a redirect list from an interface, use the `no ip redirect-group name` command.

**Parameters**                *redirect-list-name*            Enter the name of a configured redirect list.

**Defaults**                    none

**Command Modes**            INTERFACE (conf-if-vl-)

**Command History**

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |
| 8.4.2.1  | Introduced on the C-Series and S-Series.           |
| 8.4.2.0  | Introduced on the E-Series Tera Scale.             |
| 7.7.1.0  | Introduced on the E-Series ExaScale.               |

**Usage Information**        You can apply any number of redirect-groups to an interface. A redirect list can contain any number of configured rules. These rules includes the next-hop IP address where the incoming traffic is to be redirected.

If the next hop address is reachable, traffic is forwarded to the specified next hop. Otherwise, the normal routing table is used to forward traffic. When a redirect-group is applied to an interface and the next-hop is reachable, the rules are added

into the PBR CAM region. When incoming traffic hits an entry in the CAM, the traffic is redirected to the corresponding next-hop IP address specified in the rule.

**NOTE:** Apply the redirect list to physical, VLAN, or LAG interfaces only.

#### Related Commands

- [show cam pbr](#) – displays the content of the PBR CAM.
- [show ip redirect-list](#) – displays the redirect-list configuration.

## ip redirect-list

Configure a redirect list and enter REDIRECT-LIST mode.

### S4820T

#### Syntax

```
ip redirect-list redirect-list-name
```

To remove a redirect list, use the `no ip redirect-list` command.

#### Parameters

|                                  |                                    |
|----------------------------------|------------------------------------|
| <b><i>redirect-list-name</i></b> | Enter the name of a redirect list. |
|----------------------------------|------------------------------------|

#### Defaults

None

#### Command Modes

CONFIGURATION

#### Command History

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |

| 8.4.2.0  | Introduced on the E-Series Tera Scale.             |
| 7.7.1.0  | Introduced on the E-Series ExaScale.               |

# permit

Configure a permit rule. A permit rule excludes the matching packets from PBR classification and routes them using conventional routing.

## S4820T

### Syntax

```
permit {ip-protocol-number | protocol-type} {source mask | any  
| host ip-address} {destination mask | any | host ip-address}  
[bit] [operators]
```

To remove the rule, use one of the following:

- If you know the filter sequence number, use the `no seq sequence-number syntax` command.
- You can also use the `no permit {ip-protocol-number | protocol-type} {source mask | any | host ip-address} {destination mask | any | host ip-address} [bit] [operators]` command.

### Parameters

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-protocol-number</i></b> | Enter a number from 0 to 255 for the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                                                                                           |
| <b><i>protocol-type</i></b>      | Enter one of the following keywords as the protocol type: <ul style="list-style-type: none"><li>• <code>icmp</code> for internet control message protocol</li><li>• <code>ip</code> for any internet protocol</li><li>• <code>tcp</code> for transmission control protocol</li><li>• <code>udp</code> for user datagram protocol</li></ul>                                                                    |
| <b><i>source</i></b>             | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                 |
| <b><i>mask</i></b>               | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>any</i></b>                | Enter the keyword <code>any</code> to specify that all traffic is subject to the filter.                                                                                                                                                                                                                                                                                                                      |
| <b><i>host ip-address</i></b>    | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                         |
| <b><i>destination</i></b>        | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                    |
| <b><i>bit</i></b>                | (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags: <ul style="list-style-type: none"><li>• <code>ack</code> = acknowledgement</li><li>• <code>fin</code> = finish (no more data from the user)</li><li>• <code>psh</code> = push function</li><li>• <code>rst</code> = reset the connection</li><li>• <code>syn</code> = synchronize sequence number</li></ul> |

- `urg` = urgent field

**operator** (OPTIONAL) For TCP and UDP parameters only. Enter one of the following logical operand:

- `eq` = equal to
- `neq` = not equal to
- `gt` = greater than
- `lt` = less than
- `range` = inclusive range of ports (you must specify two ports for the `portcommand` parameter.)

**Defaults** none

**Command Modes** REDIRECT-LIST

**Command History**

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |
| 8.4.2.1  | Introduced on the C-Series and S-Series.           |
| 8.4.2.0  | Introduced on the E-Series Tera Scale.             |
| 7.7.1.0  | Introduced on the E-Series ExaScale.               |

## redirect

Configure a rule for the redirect list.

### S4820T

**Syntax**

```
redirect {ip-address | slot/port} | tunnel tunnel-id}[track
<obj-id>] {ip-protocol-number | protocol-type [bit]} {source
mask | any | host ip-address} {destination mask | any | host
ip-address} [operator]
```

To remove this filter, use one of the following:

- Use the `no seq sequence-number` command if you know the filter's sequence number.
- You can also use the `no redirect {ip-address | slot/port} | tunnel tunnel-id}[track <obj-id>] {ip-protocol-number [bit] | protocol-type} {source mask | any | host ip-address}`

`{destination mask | any | host ip-address} [operator]`  
command.

## Parameters

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>redirect</b>             | Enter the keyword <code>redirect</code> to assign the sequence to the redirect list.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ip-address</b>           | Enter the IP address of the forwarding router.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>slot/port</b>            | Enter the keyword <code>slot / port</code> followed by the slot/port information.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>tunnel</b>               | Enter the keyword <code>tunnel</code> to configure the tunnel setting.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>tunnel-id</b>            | Enter the keyword <code>tunnel-id</code> to redirect the traffic.                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>track</b>                | Enter the keyword <code>track</code> to enable the tracking.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>track &lt;obj-id&gt;</b> | Enter the keyword <code>track &lt;obj-id&gt;</code> to track object-id.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ip-protocol-number</b>   | Enter a number from 0 to 255 for the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>protocol-type</b>        | Enter one of the following keywords as the protocol type: <ul style="list-style-type: none"><li>• <code>icmp</code> for internet control message protocol</li><li>• <code>ip</code> for any internet protocol</li><li>• <code>tcp</code> for transmission control protocol</li><li>• <code>udp</code> for user datagram protocol</li></ul>                                                                                                              |
| <b>bit</b>                  | (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags: <ul style="list-style-type: none"><li>• <code>ack</code> = acknowledgement</li><li>• <code>fin</code> = finish (no more data from the user)</li><li>• <code>psh</code> = push function</li><li>• <code>rst</code> = reset the connection</li><li>• <code>syn</code> = synchronize sequence number</li><li>• <code>urg</code> = urgent field</li></ul> |
| <b>source</b>               | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>mask</b>                 | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>any</b>                  | Enter the keyword <code>any</code> to specify that all traffic is subject to the filter.                                                                                                                                                                                                                                                                                                                                                                |
| <b>host ip-address</b>      | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                   |
| <b>destination</b>          | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>operator</b>             | (OPTIONAL) For TCP and UDP parameters only. Enter one of the following logical operand:                                                                                                                                                                                                                                                                                                                                                                 |

- `eq` = equal to
- `neq` = not equal to
- `gt` = greater than
- `lt` = less than
- `range` = inclusive range of ports (you must specify two ports for the `port` command parameter.)

**Defaults** none

**Command Modes** REDIRECT-LIST

| Command History | Version  | Description                                                            |
|-----------------|----------|------------------------------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                                            |
|                 | 9.7(0.0) | Added support for the track-id on the S4810, S4820T, S6000, and Z9000. |
|                 | 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000.                     |
|                 | 8.4.2.1  | Introduced on the C-Series and S-Series.                               |
|                 | 8.4.2.0  | Introduced on the E-Series Tera Scale.                                 |
|                 | 7.7.1.0  | Introduced on the E-Series ExaScale.                                   |

## seq

Configure a filter with an assigned sequence number for the redirect list.

### S4820T

**Syntax**

```
seq sequence-number {permit | redirect {ip-address | tunnel
tunnel-id}[track <obj-id> ]} {ip-protocol-number | protocol-
type} {source mask | any | host ip-address} {destination mask |
any | host ip-address} [bit] [operator]{source-port source-
port| source-port-range start-port - end-port} {destination-
port destination-port| destination-port-range start-port - end-
port}
```

To delete a filter, use the `no seq sequence-number` command.

| Parameters             |  |                                                                               |
|------------------------|--|-------------------------------------------------------------------------------|
| <b>sequence-number</b> |  | Enter a number from 1 to 65535.                                               |
| <b>permit</b>          |  | Enter the keyword <code>permit</code> assign the sequence to the permit list. |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>redirect</b>             | Enter the keyword <code>redirect</code> to assign the sequence to the redirect list.                                                                                                                                                                                                                                                                                                                                                                           |
| <b>ip-address</b>           | Enter the keyword <code>IP address</code> of the forwarding router.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>tunnel</b>               | Enter the keyword <code>tunnel</code> to configure the tunnel setting.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>tunnel-id</b>            | Enter the keyword <code>tunnel-id</code> to redirect the traffic.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>track</b>                | Enter the keyword <code>track</code> to enable the tracking.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>track &lt;obj-id&gt;</b> | Enter the keyword <code>track &lt;obj-id&gt;</code> to track object-id.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ip-protocol-number</b>   | Enter the keyword <code>ip-protocol-number</code> then the number from 0 to 255 for the protocol identified in the IP protocol header.                                                                                                                                                                                                                                                                                                                         |
| <b>protocol-type</b>        | Enter one of the following keywords as the protocol type: <ul style="list-style-type: none"> <li>• <code>icmp</code> for internet control message protocol</li> <li>• <code>ip</code> for any internet protocol</li> <li>• <code>tcp</code> for transmission control protocol</li> <li>• <code>udp</code> for user datagram protocol</li> </ul>                                                                                                                |
| <b>source</b>               | Enter the IP address of the network or host from which the packets were sent.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>mask</b>                 | Enter a network mask in /prefix format (/x).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>any</b>                  | Enter the keyword <code>any</code> to specify that all traffic is subject to the filter.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>host ip-address</b>      | Enter the keyword <code>host</code> then the IP address to specify a host IP address.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>destination</b>          | Enter the IP address of the network or host to which the packets are sent.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>bit</b>                  | (OPTIONAL) For the TCP protocol type only, enter one or a combination of the following TCP flags: <ul style="list-style-type: none"> <li>• <code>ack</code> = acknowledgement</li> <li>• <code>fin</code> = finish (no more data from the user)</li> <li>• <code>psh</code> = push function</li> <li>• <code>rst</code> = reset the connection</li> <li>• <code>syn</code> = synchronize sequence number</li> <li>• <code>urg</code> = urgent field</li> </ul> |
| <b>operator</b>             | (OPTIONAL) For the TCP and UDP parameters only. Enter one of the following logical operand: <ul style="list-style-type: none"> <li>• <code>eq</code> = equal to</li> <li>• <code>neq</code> = not equal to</li> <li>• <code>gt</code> = greater than</li> </ul>                                                                                                                                                                                                |

- `lt` = less than
- `range` = inclusive range of ports (you must specify two ports for the port command parameter.)

|                                      |                                                                                                                                                     |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>source port</i></b>            | Enter the keywords <code>source-port</code> then the port number to be matched in the ACL rule in the ICAP rule                                     |
| <b><i>destination-port</i></b>       | Enter the keywords <code>destination-port</code> then the port number to be matched in the ACL rule in the ICAP rule.                               |
| <b><i>source-port-range</i></b>      | Enter the keywords <code>source-port-range</code> then the range of the start port to end port to be matched in the ACL rule in the ICAP rule.      |
| <b><i>destination-port-range</i></b> | Enter the keywords <code>destination-port-range</code> then the range of the start port to end port to be matched in the ACL rule in the ICAP rule. |

**Defaults** none

**Command Modes** REDIRECT-LIST

|                        |                |                                                                        |
|------------------------|----------------|------------------------------------------------------------------------|
| <b>Command History</b> | <b>Version</b> | <b>Description</b>                                                     |
|                        | 9.7(0.0)       | Introduced on the S6000-ON.                                            |
|                        | 9.7(0.0)       | Added support for the track-id on the S4810, S4820T, S6000, and Z9000. |
|                        | 9.4(0.0)       | Introduced on the S4810, S4820T, S6000, and Z9000.                     |

## show cam pbr

Display the PBR CAM content.

### S4820T

**Syntax** `show cam pbr {[interface interface] | stack-unit slot-number port-set number} [summary]`

|                   |                                                    |                                                                          |
|-------------------|----------------------------------------------------|--------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>interface</i></b><br><b><i>interface</i></b> | Enter the keyword <code>interface</code> then the name of the interface. |
|                   | <b><i>stack-unit</i></b><br><b><i>number</i></b>   | Enter the keyword <code>stack-unit</code> then the slot number.          |
|                   | <b><i>port-set</i></b><br><b><i>number</i></b>     | Enter the keywords <code>port-set</code> then the port-pipe number.      |

**summary** Enter the keyword `summary` to view only the total number of CAM entries.

**Defaults** none

**Command Modes** EXEC

**Command History**

| Version | Description |
|---------|-------------|
|---------|-------------|

|          |                             |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
|----------|-----------------------------|

|          |                                                    |
|----------|----------------------------------------------------|
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |
|----------|----------------------------------------------------|

**Usage Information** The `show cam pbr` command displays the PBR CAM content.

**Example**

```
Dell#show cam pbr stack-unit 1 port-set 0
```

```
TCP Flag: Bit 5 - URG, Bit 4 - ACK, Bit 3 - PSH, Bit 2 - RST, Bit 1 - SYN, Bit 0 - FIN
```

| Cam Index | Port | VlanID        | Proto | Tcp Flag | Src  | Dst               | Egress           |
|-----------|------|---------------|-------|----------|------|-------------------|------------------|
|           | Port | MAC           |       |          | Port |                   |                  |

```

**Related Commands**

- [ip redirect-group](#) – applies a redirect group to an interface.
- [show ip redirect-list](#) – displays the redirect-list configuration.

# show ip redirect-list

View the redirect list configuration and the interfaces it is applied to.

## S4820T

**Syntax** `show ip redirect-list redirect-list-name`

**Parameters**

|                                  |                                               |
|----------------------------------|-----------------------------------------------|
| <b><i>redirect-list-name</i></b> | Enter the name of a configured Redirect list. |
|----------------------------------|-----------------------------------------------|

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Example**

```
Dell#show ip redirect-list explicit_tunnel
IP redirect-list explicit_tunnel:
Defined as:
seq 5 redirect tunnel 1 track 1 tcp 155.55.2.0/24
222.22.2.0/24, Track 1 [up], Next-hop reachable (via Te 1/32)

## PIM-Sparse Mode (PIM-SM)

The protocol-independent multicast (PIM) commands are supported by the Dell Networking operating software on the platform.

### IPv4 PIM-Sparse Mode Commands

The following describes the IPv4 PIM-sparse mode (PIM-SM) commands.

#### clear ip pim rp-mapping

The bootstrap router (BSR) feature uses this command to remove all or particular rendezvous point (RP) advertisement.

#### S4820T

|                        |                                                                                                                                                                |                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ip pim [vrf vrf-name] rp-mapping [rp-address]</code>                                                                                               |                                                                                                                      |
| <b>Parameters</b>      | <b>vrf vrf-name</b>                                                                                                                                            | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF. |
|                        |                                                                             | <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF.                              |
|                        | <b>rp-address</b>                                                                                                                                              | (OPTIONAL) Enter the RP address in dotted decimal format (A.B.C.D).                                                  |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |                                                                                                                      |

|                        | 9.7(0.0)                                                                                                                                                       | Added support for VRF. Introduced on the S6000-ON.                                                                   |
|                        | 9.5(0.1)                                                                                                                                                       | Introduced on the Z9500.                                                                                             |

| Version  | Description                          |
|----------|--------------------------------------|
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |

### Usage Information

This command re-applies the RP mapping logic for all the groups learnt by the node. Any stale information corresponding to the existing mapping configuration is updated. As a result, the existing BSR cache and the \*,G's are deleted only if these entries are stale.

## clear ip pim tib

Clear PIM tree information from the PIM database.

### S4820T

#### Syntax

```
clear ip pim [vrf vrf-name] tib [group]
```

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**group** (OPTIONAL) Enter the multicast group address in dotted decimal format (A.B.C.D).

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |

| Version | Description                          |
|---------|--------------------------------------|
| 8.3.7.0 | Introduced on the S4810.             |
| 8.1.1.0 | Introduced on the E-Series ExaScale. |
| 7.8.1.0 | Introduced on the S-Series.          |

### Usage Information

If you use this command on a local VLT node, all multicast routes from the local PIM TIB, the entire multicast route table, and all the entries in the data plane are deleted. The local VLT node sends a request to the peer VLT node to download multicast routes learned by the peer. Both local and synced routes are removed from the local VLT node multicast route table. The peer VLT node clears synced routes from the node.

If you use this command on a peer VLT node, only the synced routes are deleted from the multicast route table.

## debug ip pim

View IP PIM debugging messages.

### S4820T

#### Syntax

```
debug ip pim [vrf vrf-name] [bsr | events | group | packet [in | out] | register | state | timer [assert | hello | joinprune | register]]
```

To disable PIM debugging, use the `no debug ip pim [vrf vrf-name]` command or use the `undebug all` to disable all debugging command.

#### Parameters

***vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to view IP PIM debugging messages corresponding to that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

***bsr*** (OPTIONAL) Enter the keyword `bsr` to view PIM Candidate RP/BSR activities.

***events*** (OPTIONAL) Enter the keyword `group` to view PIM messages for a specific group.

***group*** (OPTIONAL) Enter the keyword `group` to view PIM messages for a specific group.

***packet* [*in* | *out*]** (OPTIONAL) Enter the keyword `packet` to view PIM packets. Enter one of the optional parameters:

- `in`: to view incoming packets
- `out`: to view outgoing packets

|                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>register</b>                                      | (OPTIONAL) Enter the keyword <code>register</code> to view PIM register address in dotted decimal format (A.B.C.D).                                                                                                                                                                                                                                                                                                                    |
| <b>state</b>                                         | (OPTIONAL) Enter the keyword <code>state</code> to view PIM state changes.                                                                                                                                                                                                                                                                                                                                                             |
| <b>timer [assert   hello   joinprune   register]</b> | (OPTIONAL) Enter the keyword <code>timer</code> to view PIM timers. Enter one of the optional parameters: <ul style="list-style-type: none"> <li><code>assert</code>: to view the assertion timer</li> <li><code>hello</code>: to view the PIM neighbor keepalive timer</li> <li><code>joinprune</code>: to view the expiry timer (join/prune timer)</li> <li><code>register</code>: to view the register suppression timer</li> </ul> |

**Defaults** Disabled.

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 7.8.1.0  | Introduced on the S-Series.                        |

## ip pim bsr-border

Define the border of PIM domain by filtering inbound and outbound PIM-BSR messages per interface.

**Syntax** `ip pim bsr-border`  
To return to the default value, use the `no ip pim bsr-border` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.5(0.1) | Introduced on the Z9500.             |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |

## Usage Information

This command is applied to the subsequent PIM-BSR. Existing BSR advertisements are cleaned up by time-out. To clean the candidate RP advertisements, use the `clear ip pim rp-mapping` command.

## ip pim bsr-candidate

To join the Bootstrap election process, configure the PIM router.

### S4820T

#### Syntax

```
ip pim [vrf vrf-name] bsr-candidate interface [hash-mask-length] [priority]
```

To return to the default value, use the `no ip pim bsr-candidate [vrf vrf-name]` command.

#### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure the PIM router on a VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>interface</b>    | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a VLAN, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |

***hash-mask-length*** (OPTIONAL) Enter the hash mask length. The range is from zero (0) to 32. The default is **30**.

***priority*** (OPTIONAL) Enter the priority used in Bootstrap election process. The range is from zero (0) to 255. The default is **zero (0)**.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.7.0  | Introduced on the S4810.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 6.1.1.0  | Added support for the VLAN interface.              |

## ip pim dr-priority

Change the designated router (DR) priority for the interface.

**Syntax** `ip pim dr-priority priority-value`  
 To remove the DR priority value assigned, use the `no ip pim dr-priority` command.

**Parameters** ***priority-value*** Enter a number. Preference is given to larger/higher number. The range is from 0 to 4294967294. The default is 1.

**Defaults** **1**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                   |
|----------|---------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                   |
| 9.5(0.1) | Introduced on the Z9500.                                      |
| 9.0.2.0  | Introduced on the S6000.                                      |
| 8.3.19.0 | Introduced on the S4820T.                                     |
| 8.3.11.1 | Introduced on the Z9000.                                      |
| 8.3.7.0  | Introduced on the S4810.                                      |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                          |
| 7.8.1.0  | Introduced on the C-Series on port-channels and the S-Series. |

**Usage Information**

The router with the largest value assigned to an interface becomes the designated router. If two interfaces contain the same designated router priority value, the interface with the largest interface IP address becomes the designated router.

## ip pim join-filter

Permit or deny PIM Join/Prune messages on an interface using an extended IP access list. This command prevents the PIM-SM router from creating state based on multicast source and/or group.

### S4820T

**Syntax**

```
ip pim [vrf vrf-name] join-filter ext-access-list
```

To remove the access list, use the `no ip pim [vrf vrf-name] join-filter ext-access-list` command.

**Parameters**

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf vrf-name</b>    | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to permit or deny PIM join or prune messages on an interface associated with that VRF. |
| <b>ext-access-list</b> | Enter the name of an extended access list.                                                                                                                           |

**Defaults**

none

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.7(0.0) | Removed the in and out parameters. Introduced on the S6000-ON.     |
| 9.5(0.1) | Introduced on the Z9500.                                           |
| 9.0.2.0  | Introduced on the S6000.                                           |
| 8.3.19.0 | Introduced on the S4820T.                                          |
| 8.3.11.1 | Introduced on the Z9000.                                           |
| 8.3.7.0  | Introduced on the S4810.                                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                               |
| 7.8.1.0  | Introduced on the C-Series for the port-channels and the S-Series. |
| 7.7.1.0  | Introduced on the E-Series.                                        |

#### Example

```
Dell(conf)# ip access-list extended iptv-channels
Dell(config-ext-nacl)# permit ip 10.1.2.3/24 225.1.1.0/24
Dell(config-ext-nacl)# permit ip any 232.1.1.0/24
Dell(config-ext-nacl)# permit ip 100.1.1.0/16 any
```

#### Related Commands

[ip access-list extended](#) — configure an access list based on IP addresses or protocols.

## ip pim ingress-interface-map

When the Dell Networking system is the RP, statically map potential incoming interfaces to (\*,G) entries to create a lossless multicast forwarding environment.

**Syntax** `ip pim ingress-interface-map std-access-list`

**Parameters**

***std-access-list*** Enter the name of a standard access list.

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description              |
|----------|--------------------------|
| 8.3.12.0 | Introduced on the S4810. |
| 8.4.1.0  | Introduced               |

#### Example

```
Dell(config)# ip access-list standard map1
Dell(config-std-nacl)# permit 224.0.0.1/24
Dell(config-std-nacl)#exit
Dell(config)#int tengig 1/1
Dell(config-if-te-1/1)# ip pim ingress-interface-map map1
```

## ip pim neighbor-filter

To prevent a router from participating in protocol independent multicast (PIM), configure this feature.

### S4820T

#### Syntax

```
ip pim [vrf vrf-name] neighbor-filter {access-list}
```

To remove the restriction, use the `no ip pim [vrf vrf-name] neighbor-filter {access-list}` command.

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to prevent that VRF from participating in PIM.

**NOTE:** Applies to specific VRF if input is provided, else applies to default VRF.

**access-list** Enter the name of a standard access list. Maximum 16 characters.

#### Defaults

none

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |

| Version | Description                              |
|---------|------------------------------------------|
| 8.3.7.0 | Introduced on the S4810.                 |
| 8.1.1.0 | Introduced on the E-Series ExaScale.     |
| 7.8.1.0 | Introduced on the C-Series and S-Series. |
| 7.6.1.0 | Introduced on the E-Series.              |

#### Usage Information

Do not enter this command before creating the access-list.

## ip pim query-interval

Change the frequency of PIM Router-Query messages.

#### Syntax

`ip pim query-interval seconds`

To return to the default value, use the `no ip pim query-interval seconds` command.

#### Parameters

**seconds**

Enter a number as the number of seconds between router query messages. The range is from 0 to 65535. The default is **30 seconds**.

#### Defaults

**30 seconds**

| 7.6.1.0                                                                           | Introduced                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                     |                                                                                |                                                                                   |                                                                                         |                    |                                                                   |         |                          |          |                           |          |                          |         |                          |         |                                          |         |            |
| <b>Usage Information</b>                                                          | The access name is an extended IP access list that denies PIM register packets to RP at the source DR based on the multicast and group addresses. Do not enter this command before creating the access-list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                     |                                                                                |                                                                                   |                                                                                         |                    |                                                                   |         |                          |          |                           |          |                          |         |                          |         |                                          |         |            |

## ip pim rp-address

Configure a static PIM rendezvous point (RP) address for a group or access-list.

### S4820T

**Syntax** `ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]`

To remove an RP address, use the `no ip pim [vrf vrf-name] rp-address address {group-address group-address mask} [override]` command.

### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**address** Enter the RP address in dotted decimal format (A.B.C.D).

**group-address group-address mask** Enter the keywords `group-address` then a group-address mask, in dotted decimal format (/xx), to assign that group address to the RP.

**override** Enter the keyword `override` to override the BSR updates with static RP. The override takes effect immediately during enable/disable.

**NOTE:** This option is applicable to multicast group range.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.7.0  | Introduced on the S4810.                           |

| Version      | Description                          |
|--------------|--------------------------------------|
| 8.1.1.0      | Introduced on the E-Series ExaScale. |
| 7.8.1.0      | Introduced on the S-Series.          |
| pre- 6.1.1.1 | Introduced on the E-Series.          |

### Usage Information

First-hop routers use this address by to send register packets on behalf of source multicast hosts. The RP addresses are stored in the order in which they are entered. The RP is chosen based on a longer prefix match for a group. The RP selection does not depend on dynamic or static RP assignments.

## ip pim rp-candidate

To send out a Candidate-RP-Advertisement message to the bootstrap (BS) router or define group prefixes that are defined with the RP address to PIM BSR, configure a PIM router.

### Syntax

```
ip pim [vrf vrf-name] rp-candidate {interface [priority]}
```

To return to the default value, use the `no ip pim [vrf vrf-name] rp-candidate {interface [priority]}` command.

### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**interface** Enter the following keywords and slot/port or number information:

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**priority** (OPTIONAL) Enter the priority used in Bootstrap election process. The range is zero (0) to 255. The default is **192**.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                        |
|--------------|----------------------------------------------------|
| 9.7(0.0)     | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1)     | Introduced on the Z9500.                           |
| 9.0.2.0      | Introduced on the S6000.                           |
| 8.3.19.0     | Introduced on the S4820T.                          |
| 8.3.11.1     | Introduced on the Z9000.                           |
| 8.3.7.0      | Introduced on the S4810.                           |
| 8.1.1.0      | Introduced on the E-Series ExaScale.               |
| 7.8.1.0      | Introduced on the S-Series.                        |
| pre- 6.1.1.1 | Introduced on the E-Series.                        |

## Usage Information

Priority is stored at BSR router when receiving a Candidate-RP-Advertisement.

## ip pim sparse-mode

Enable PIM sparse mode and IGMP on the interface.

### Syntax

```
ip pim sparse-mode
```

To disable PIM sparse mode and IGMP, use the `no ip pim sparse-mode` command.

### Defaults

Disabled.

### Command Modes

INTERFACE

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.                                           |
| 8.3.7.0  | Introduced on the S4810.                                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                               |
| 7.8.1.0  | Introduced on the C-Series for the port-channels and the S-Series. |

**Usage Information**

The interface must be enabled (the `no shutdown` command) and not have the `switchport` command configured. Multicast must also be enabled globally (using the `ip multicast-lag-hashing` command). PIM is supported on the port-channel interface.

## ip pim sparse-mode sg-expiry-timer

Enable expiry timers globally for all sources.

### S4820T

**Syntax**

```
ip pim [vrf vrf-name] sparse-mode sg-expiry-timer seconds
```

To disable configured timers and return to default mode, use the `no ip pim [vrf vrf-name] sparse-mode sg-expiry-timer` command.

**Parameters**

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to enable expiry timer for all sources on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**seconds** Enter the number of seconds the S, G entries are retained. The range is from 211 to 65535.

**Defaults**

Disabled. The default expiry timer (with no times configured) is 210 sec.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Removed the <code>acl-access-list</code> parameter. Modified the max value of S, G entry second range from 86400 to 65535. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                                                                                                                                                      |

| Version  | Description                                                        |
|----------|--------------------------------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                                           |
| 8.3.19.0 | Introduced on the S4820T.                                          |
| 8.3.11.1 | Introduced on the Z9000.                                           |
| 8.3.7.0  | Introduced on the S4810.                                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                               |
| 7.8.1.0  | Introduced on the C-Series for the port-channels and the S-Series. |
| 7.7.1.1  | Introduced                                                         |

#### Usage Information

This command configures an expiration timer for all S.G entries, unless they are assigned to an Extended ACL.

Even though the FHR nodes act as RPs, these nodes still send *Register encap* messages to themselves and expect to receive a *Register stop* message (for Anycast RP support). As a result, if the DLT timer expires, SG is not deleted until the register state is deleted in the node. This register state expires 210 seconds after the last Null register is received.

## ip pim ssm-range

Specify the SSM group range using an access list.

**Syntax** `ip pim [vrf vrf-name] ssm-range {access_list_name}`

#### Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to specify the SSM group range for that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

**access\_list\_name** Enter the name of the access list.

#### Defaults

Default SSM range is 232/8 and ff3x/32

#### Command Modes

CONFIGURATION

#### Command History

| Version  | Description                                                                                            |
|----------|--------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. Added support for VRF on S6000, S4810, S4820T, Z9000, Z9500, and S6000-ON. |
| 9.7(0.0) | Added support for VRF.                                                                                 |
| 9.5(0.1) | Introduced on the Z9500.                                                                               |

| Version  | Description                          |
|----------|--------------------------------------|
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.1  | Introduced on the S4810.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |
| 7.7.1.0  | Introduced on the C-Series.          |
| 7.5.1.0  | Introduced on the E-Series.          |

### Usage Information

Dell Networking OS supports standard access lists for the SSM range. You cannot use extended ACLs for configuring the SSM range. If you configure an extended ACL and then used in the `ip pim ssm-range {access list name}` configuration, an error is reported.

However, if you configure `ip pim ssm-range {access list name}` first and then you configure the ACL as an Extended ACL, an error is not reported and the ACL is not applied to the SSM range.

Dell Networking OS-recommended best-practices are to configure the standard ACL, and then apply the ACL to the SSM range. After the SSM range is applied, the changes are applied internally without requiring clearing of the tree information base (TIB).

When the ACL rules change, the ACL and protocol-independent multicast (PIM) modules apply the new rules automatically.

When you configure the SSM range, Dell Networking OS supports SSM for configured group range as well as the default SSM range.

When you remove the SSM ACL, PIM SSM is supported for the default SSM range only.

## ip pim spt-threshold

To switch to the shortest path tree when the traffic reaches the specified threshold value, configure the PIM router.

### S4820T

#### Syntax

```
ip pim [vrf vrf-name] spt-threshold [infinity]
```

To return to the default value, use the `no ip pim [vrf vrf-name] spt-threshold [infinity]` command.

|                   |                            |                                                                                                                                                                           |
|-------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf <i>vrf-name</i></b> | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure the PIM router on that VRF.                                                    |
|                   |                            |  <b>NOTE:</b> Applies to specific VRF if input is provided, else applies to Default VRF. |
|                   | <b>infinity</b>            | (OPTIONAL) Enter the keyword <code>infinity</code> to never switch to the source-tree.                                                                                    |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |

**Usage Information** This command is applicable to last hop routers on the shared tree towards the rendezvous point (RP).

## no ip pim snooping dr-flood

Disable the flooding of multicast packets to the PIM designated router.

**Syntax** `no ip pim snooping dr-flood`  
To re-enable the flooding of multicast packets to the PIM designated router, use the `ip pim snooping dr-flood` command.

**Defaults** Enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.5(0.1) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.12.0 | Introduced on the S4810.             |
| 8.4.1.0  | Introduced on the E-Series ExaScale. |

### Usage Information

By default, when you enable PIM-SM snooping, a switch floods all multicast traffic to the PIM designated router (DR), including unnecessary multicast packets. To minimize the traffic sent over the network to the designated router, you can disable `designated-router flooding`.

When `designated-router flooding` is disabled, PIM-SM snooping only forwards the multicast traffic, which belongs to a multicast group for which the switch receives a join request, on the port connected towards the designated router.

If the PIM DR flood is not disabled (default setting):

- Multicast traffic is transmitted on the egress port towards the PIM DR if the port is not the incoming interface.
- Multicast traffic for an unknown group is sent on the port towards the PIM DR. When DR flooding is disabled, multicast traffic for an unknown group is dropped.

## show ip pim bsr-router

View information on the Bootstrap router.

### S4820T

**Syntax** `show ip pim [vrf vrf-name] bsr-router`

**Parameters** `vrf vrf-name` (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.3.7.0  | Introduced on the S4810.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 7.8.1.0  | Introduced on the S-Series.                        |

### Example

```
Dell#show ip pim bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (v2)
  BSR address: 7.7.7.7 (?)
  BSR Priority: 0, Hash mask length: 30
  Next bootstrap message in 00:00:08

This system is a candidate BSR
  Candidate BSR address: 7.7.7.7, priority: 0, hash mask
  length: 30
```

## show ip pim interface

View information on the interfaces with IP PIM enabled.

### S4820T

#### Syntax

```
show ip pim [vrf vrf-name] interface
```

#### Parameters

***vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on this VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 7.8.1.0  | Introduced on the S-Series.                        |

#### Usage Information

The following describes the `show ip pim interface` command shown in the following example.

| Field       | Description                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address     | Lists the IP addresses of the interfaces participating in PIM.                                                                                                                      |
| Interface   | List the interface type, with either slot/port information or ID (VLAN or Port Channel), of the interfaces participating in PIM.                                                    |
| Ver/Mode    | Displays the PIM version number and mode for each interface participating in PIM: <ul style="list-style-type: none"> <li>v2 = PIM version 2</li> <li>S = PIM Sparse mode</li> </ul> |
| Nbr Count   | Displays the number of PIM neighbors discovered over this interface.                                                                                                                |
| Query Intvl | Displays the query interval for Router Query messages on that interface (configured with <code>ip pim query-interval</code> command).                                               |
| DR Prio     | Displays the Designated Router priority value configured on the interface (use the <code>ip pim dr-priority</code> command).                                                        |
| DR          | Displays the IP address of the Designated Router for that interface.                                                                                                                |

The `show ip pim interface` command does not display information corresponding to the loop-back interfaces.

#### Example

```
Dell#show ip pim interface
Address          Interface  Ver/  Nbr   Query  DR      DR
                Mode      Count Intvl  Prio
165.87.34.5     Te 1/10   v2/S  0     30     1
165.87.34.5     V1 10     v2/S  1     30     1
10.1.1.2        V1 20     v2/S  1     30     1
20.1.1.5        V1 20     v2/S  1     30     1
```

```
165.87.31.200 V1 30 v2/S 1 30 1
165.87.31.201
```

## show ip pim neighbor

View PIM neighbors.

### S4820T

**Syntax** `show ip pim [vrf vrf-name] neighbor`

**Parameters**

***vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 7.8.1.0  | Introduced on the S-Series.                        |

### Usage Information

The following describes the `show ip pim neighbor` command shown in the following example.

| Field                   | Description                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor address</b> | Displays the IP address of the PIM neighbor.                                                                                  |
| <b>Interface</b>        | List the interface type, with either slot/port information or ID (VLAN or Port Channel), on which the PIM neighbor was found. |

| Field                 | Description                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Uptime/expires</b> | Displays the amount of time the neighbor has been up then the amount of time until the neighbor is removed from the multicast routing table (that is, until the neighbor hold time expires).                                                              |
| <b>Ver</b>            | Displays the PIM version number. <ul style="list-style-type: none"> <li>v2 = PIM version 2</li> </ul>                                                                                                                                                     |
| <b>DR prio/Mode</b>   | Displays the Designated Router priority and the mode. <ul style="list-style-type: none"> <li>1 = default Designated Router priority (use the <code>ip pim dr-priority</code> command)</li> <li>DR = Designated Router</li> <li>S = Sparse mode</li> </ul> |

#### Example

```
Dell#show ip pim neighbor
Neighbor   Interface  Uptime/Expires   Ver   DR
Address
127.87.3.4 Te 1/16   09:44:58/00:01:24 v2    1 / S
Dell#
```

## show ip pim rp

View all multicast groups-to-RP mappings.

### S4820T

#### Syntax

```
show ip pim [vrf vrf-name] rp [mapping | group-address]
```

#### Parameters

|                             |                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vrf vrf-name</i></b>  | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF.                 |
| <b><i>mapping</i></b>       | (OPTIONAL) Enter the keyword <code>mapping</code> to display the multicast groups-to-RP mapping and information on how RP is learnt. |
| <b><i>group-address</i></b> | (OPTIONAL) Enter the multicast group address mask in dotted decimal format to view RP for a specific group.                          |

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |
| 8.3.11.1 | Introduced on the Z9000.                           |
| 8.1.1.0  | Introduced on the E-Series ExaScale.               |
| 7.8.1.0  | Introduced on the S-Series.                        |

#### Example

```
Dell#show ip pim rp
Group          RP
224.2.197.115  165.87.20.4
224.2.217.146  165.87.20.4
224.3.3.3      165.87.20.4
225.1.2.1      165.87.20.4
225.1.2.2      165.87.20.4
229.1.2.1      165.87.20.4
229.1.2.2      165.87.20.4
Dell#
```

#### Example (Mapping)

```
Dell#show ip pim rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4, Static
  RP: 50.40.4.4, v2
Dell#
```

#### Example (Address)

```
Dell#show ip pim rp 229.1.2.1
Group          RP
229.1.2.1      165.87.20.4
```

## show ip pim snooping interface

Display information on VLAN interfaces with PIM-SM snooping enabled.

#### Syntax

```
show ip pim snooping interface [vlan vlan-id]
```

#### Parameters

**vlan *vlan-id*** (OPTIONAL) Enter a VLAN ID to display information about a specified VLAN configured for PIM-SM snooping. The valid VLAN IDs range is from 1 to 4094.

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.5(0.1) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.12.0 | Introduced on the S4810.             |
| 8.4.1.1  | Introduced on the E-Series ExaScale. |

#### Usage Information

The following describes the `show ip pim snooping interface` commands shown in the following example.

| Field     | Description                                                                                                                                                                          |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Displays the VLAN interfaces with PIM-SM snooping enabled.                                                                                                                           |
| Ver/Mode  | Displays the PIM version number for each VLAN interface with PIM-SM snooping enabled: <ul style="list-style-type: none"><li>v2 = PIM version 2</li><li>S = PIM Sparse mode</li></ul> |
| Nbr Count | Displays the number of neighbors learned through PIM-SM snooping on the interface.                                                                                                   |
| DR Prio   | Displays the Designated Router priority value configured on the interface ( <code>ip pim dr-priority</code> command).                                                                |
| DR        | Displays the IP address of the Designated Router for that interface.                                                                                                                 |

#### Example (#2)

```
Dell#show ip pim snooping interface
Interface Ver Nbr   DR   DR
          Count Prio
Vlan 2    v2  3    1   165.87.32.2
```

## show ip pim snooping neighbor

Display information on PIM neighbors learned through PIM-SM snooping.

**Syntax** `show ip pim snooping neighbor [vlan vlan-id]`

**Parameters**

|                            |                                                                                                                                                                        |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-id</i></b> | (OPTIONAL) Enter a VLAN ID to display information about PIM neighbors that PIM-SM snooping discovered on a specified VLAN. The valid VLAN IDs range is from 1 to 4094. |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.5(0.1) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.12.0 | Introduced on the S4810.             |
| 8.4.1.1  | Introduced on the E-Series ExaScale. |

## Usage Information

The following describes the `show ip pim snooping neighbor` commands shown in the following example.

| Field            | Description                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor address | Displays the IP address of the neighbor learned through PIM-SM snooping.                                                                                                                                                                              |
| Interface        | Displays the VLAN ID number and slot/port on which the PIM-SM-enabled neighbor was discovered.                                                                                                                                                        |
| Uptime/expires   | Displays the amount of time the neighbor has been up then the amount of time until the neighbor is removed from the multicast routing table (that is, until the neighbor hold time expires).                                                          |
| Ver              | Displays the PIM version number: <ul style="list-style-type: none"><li>v2 = PIM version 2</li></ul>                                                                                                                                                   |
| DR prio/Mode     | Displays the Designated Router priority and the mode: <ul style="list-style-type: none"><li>1 = default Designated Router priority (use the <code>ip pim dr-priority</code> command)</li><li>DR = Designated Router</li><li>S = Sparse mode</li></ul> |

## Example

```
Dell#show ip pim snooping neighbor
```

```
Neighbor      Interface          Uptime/Expires    Ver  DR Prio
Address
165.87.32.2   V1 2 [Te 1/13 ]    00:04:03/00:01:42 v2   1
165.87.32.10 V1 2 [Te 1/11 ]    00:00:46/00:01:29 v2   0
165.87.32.12 V1 2 [Te 2/20 ]    00:00:51/00:01:24 v2   0
```

## show ip pim snooping tib

Display information from the tree information base (TIB) PIM-SM snooping discovered about multicast group members and states.

**Syntax** `show ip pim snooping tib [vlan vlan-id] [group-address [source-address]]`

**Parameters**

|                              |                                                                                                                                                                |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-id</i></b>   | (OPTIONAL) Enter a VLAN ID to display TIB information PIM-SM snooping discovered on a specified VLAN. The valid VLAN IDs range is from 1 to 4094.              |
| <b><i>group-address</i></b>  | (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D) to display TIB information PIM-SM snooping discovered for a specified multicast group.   |
| <b><i>source-address</i></b> | (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D) to display TIB information PIM-SM snooping discovered for a specified multicast source. |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.5(0.1) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.12.0 | Introduced on the S4810.             |
| 8.4.1.1  | Introduced on the E-Series ExaScale. |

**Usage Information** The following describes the `show ip pim snooping tib` commands shown in the following example.

| Field   | Description                                                                           |
|---------|---------------------------------------------------------------------------------------|
| (S, G)  | Displays the entry in the PIM multicast snooping database.                            |
| uptime  | Displays the amount of time the entry has been in the PIM multicast route table.      |
| expires | Displays the amount of time until the entry expires and is removed from the database. |
| RP      | Displays the IP address of the RP/source for this entry.                              |

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>flags</b>                    | List the flags to define the entries: <ul style="list-style-type: none"> <li>• S = PIM Sparse Mode</li> <li>• C = directly connected</li> <li>• L = local to the multicast group</li> <li>• P = route was pruned</li> <li>• R = the forwarding entry is pointing toward the RP</li> <li>• F = Dell Networking OS is registering this entry for a multicast source</li> <li>• T = packets were received via Shortest Tree Path</li> <li>• J = first packet from the last hop router is received and the entry is ready to switch to SPT</li> <li>• K=acknowledge pending state</li> </ul> |
| <b>Incoming interface</b>       | Displays the reverse path forwarding (RPF) interface towards the RP/ source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>RPF neighbor</b>             | Displays the next hop from this interface towards the RP/ source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Outgoing interface list:</b> | Lists the interfaces that meet one of the following criteria: <ul style="list-style-type: none"> <li>• a directly connect member of the Group</li> <li>• statically configured member of the Group</li> <li>• received a (*,G) Join message</li> </ul>                                                                                                                                                                                                                                                                                                                                   |

### Example

```
Dell#show ip pim snooping tib

PIM Multicast Snooping Table
Flags: J/P - (*,G) Join/Prune, j/p - (S,G) Join/Prune
      SGR-P - (S,G,R) Prune
Timers: Uptime/Expires
* : Inherited port

(*, 225.1.2.1), uptime 00:00:01, expires 00:02:59, RP
165.87.70.1, flags: J
  Incoming interface: Vlan 2, RPF neighbor 0.0.0.0
  Outgoing interface list:
    TenGigabitEthernet 2/11 RPF 165.87.32.2 00:00:01/00:02:59
    TenGigabitEthernet 2/13 Upstream Port  -/-

Dell#show ip pim snooping tib vlan 2 225.1.2.1 165.87.1.7

PIM Multicast Snooping Table
Flags: J/P - (*,G) Join/Prune, j/p - (S,G) Join/Prune
      SGR-P - (S,G,R) Prune
Timers: Uptime/Expires
* : Inherited port

(165.87.1.7, 225.1.2.1), uptime 00:00:08, expires 00:02:52,
flags: j
  Incoming interface: Vlan 2, RPF neighbor 0.0.0.0
  Outgoing interface list:
    TenGigabitEthernet 2/11 Upstream Port  -/-
```

TenGigabitEthernet 2/13 DR Port -/-  
TenGigabitEthernet 2/20 RPF 165.87.32.10 00:00:08/00:02:52

## show ip pim ssm-range

Display the non-default groups added using the SSM range feature.

### S4820T

|                      |                                                                             |                                                                                                                      |
|----------------------|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | show ip pim [ <i>vrf vrf-name</i> ] ssm-range                               |                                                                                                                      |
| <b>Parameters</b>    | <b>vrf vrf-name</b>                                                         | (OPTIONAL) Enter the keyword <code>vrf</code> followed by the name of the VRF to configure this setting on that VRF. |
| <b>Defaults</b>      | none                                                                        |                                                                                                                      |
| <b>Command Modes</b> | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul> |                                                                                                                      |

|                        |                |                                                                                                        |
|------------------------|----------------|--------------------------------------------------------------------------------------------------------|
| <b>Command History</b> | <b>Version</b> | <b>Description</b>                                                                                     |
|                        | 9.7(0.0)       | Introduced on the S6000-ON. Added support for VRF on S6000, S4810, S4820T, Z9000, Z9500, and S6000-ON. |
|                        | 9.5(0.0)       | Introduced on the Z9500.                                                                               |
|                        | 9.0.2.0        | Introduced on the S6000.                                                                               |
|                        | 8.3.19.0       | Introduced on the S4820T.                                                                              |
|                        | 8.3.11.1       | Introduced on the Z9000.                                                                               |
|                        | 8.3.7.1        | Introduced on the S4810.                                                                               |
|                        | 8.1.1.0        | Introduced on the E-Series ExaScale.                                                                   |
|                        | 7.8.1.0        | Introduced on the S-Series.                                                                            |
|                        | 7.7.1.0        | Introduced on the C-Series.                                                                            |
|                        | 7.5.1.0        | Introduced on the E-Series.                                                                            |

**Example**      Group Address    /   MaskLen

## show ip pim summary

View information about PIM-SM operation.

### S4820T

**Syntax**            show ip pim [*vrf vrf-name*] summary

## Parameters

**vrf vrf-name** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON.                                |
| 9.5(0.1) | Introduced on the Z9500.                                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                         |
| 8.3.12.0 | Introduced on the S4810.                                                          |
| 8.3.11.1 | Introduced on the Z9000.                                                          |
| 8.4.1.1  | Support for the display of PIM-SM snooping status was added on E-Series ExaScale. |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                                              |
| 7.8.1.0  | Introduced on the S-Series.                                                       |

## Example

```
Dell# show ip pim summary

PIM TIB version 495
Uptime 22:44:52
Entries in PIM-TIB/MFC : 2/2

Active Modes :
    PIM-SNOOPING

Interface summary:
    1 active PIM interface
    0 passive PIM interfaces
    3 active PIM neighbors

TIB summary:
    1/1 (*,G) entries in PIM-TIB/MFC
    1/1 (S,G) entries in PIM-TIB/MFC
    0/0 (S,G,Rpt) entries in PIM-TIB/MFC

    0 PIM nexthops
    0 RPs
    0 sources
    0 Register states

Message summary:
```

```

2582/2583 Joins sent/received
5/0 Prunes sent/received
0/0 Candidate-RP advertisements sent/received
0/0 BSR messages sent/received
0/0 State-Refresh messages sent/received
0/0 MSDP updates sent/received
0/0 Null Register messages sent/received
0/0 Register-stop messages sent/received

```

```

Data path event summary:
0 no-cache messages received
0 last-hop switchover messages received
0/0 pim-assert messages sent/received
0/0 register messages sent/received

```

## show ip pim tib

View the PIM tree information base (TIB).

### S4820T

**Syntax** `show ip pim [vrf vrf-name] tib [group-address [source-address]]`

#### Parameters

***vrf vrf-name*** (OPTIONAL) Enter the keyword `vrf` followed by the name of the VRF to configure this setting on that VRF.

**NOTE:** Applies to specific VRF if input is provided, else applies to Default VRF.

***group-address*** (OPTIONAL) Enter the group address in dotted decimal format (A.B.C.D).

***source-address*** (OPTIONAL) Enter the source address in dotted decimal format (A.B.C.D).

#### Command Modes

- EXEC
- EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.                           |
| 9.0.2.0  | Introduced on the S6000.                           |
| 8.3.19.0 | Introduced on the S4820T.                          |
| 8.3.12.0 | Introduced on the S4810.                           |

| Version  | Description                          |
|----------|--------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.8.1.0  | Introduced on the S-Series.          |

### Usage Information

The following describes the `show ip pim tib` command shown in the following example.

| Field                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>(S, G)</b>                   | Displays the entry in the multicast PIM database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>uptime</b>                   | Displays the amount of time the entry has been in the PIM route table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>expires</b>                  | Displays the amount of time until the entry expires and is removed from the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>RP</b>                       | Displays the IP address of the RP/source for this entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>flags</b>                    | List the flags to define the entries: <ul style="list-style-type: none"> <li>• D = PIM Dense Mode</li> <li>• S = PIM Sparse Mode</li> <li>• C = directly connected</li> <li>• L = local to the multicast group</li> <li>• P = route was pruned</li> <li>• R = the forwarding entry is pointing toward the RP</li> <li>• F = Dell Networking OS is registering this entry for a multicast source</li> <li>• T = packets were received via Shortest Tree Path</li> <li>• J = first packet from the last hop router is received and the entry is ready to switch to SPT</li> <li>• K = acknowledge pending state</li> </ul> |
| <b>Incoming interface</b>       | Displays the reverse path forwarding (RPF) interface towards the RP/ source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>RPF neighbor</b>             | Displays the next hop from this interface towards the RP/ source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Outgoing interface list:</b> | Lists the interfaces that meet one of the following criteria: <ul style="list-style-type: none"> <li>• a directly connect member of the Group</li> <li>• statically configured member of the Group</li> <li>• received a (*,G) Join message</li> </ul>                                                                                                                                                                                                                                                                                                                                                                   |

### Example

```
Dell#do show ip pim tib

PIM Multicast Routing Table

```

## show running-config pim

Display the current configuration of PIM-SM snooping.

**Syntax** show running-config pim

**Command** EXEC Privilege

**Modes**

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.5(0.1) | Introduced on the Z9500.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.12.0 | Introduced on the S4810.             |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.4.1.0  | Introduced on the E-Series ExaScale. |

**Example**

```
Dell#show running-config pim
!  
ip pim snooping enable
```

# Port Monitoring

The port monitoring feature allows you to monitor network traffic by forwarding a copy of each incoming or outgoing packet from one port to another port.

## Important Points to Remember

- Port monitoring is supported on physical ports and logical interfaces, such as port channels and virtual local area networks (VLANs).
- The monitoring (destination, “MG”) and monitored (source, “MD”) ports must be on the same switch.
- In general, a monitoring port should have `no ip address` and `no shutdown` as the only configuration; Dell Networking OS permits a limited set of commands for monitoring ports; display them using the `?` command. A monitoring port also may not be a member of a VLAN.
- A total of 4 MG may be configured in a single port-pipe.
- MG and MD ports can be reside anywhere across a port-pipe.
- The Dell Networking OS supports multiple source ports to be monitored by a single destination port in one monitor session.
- One monitor session can have only one MG port.

 **NOTE:** The monitoring port should not be a part of any other configuration.

## description

Enter a description of this monitoring session.

|                      |                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>description {description}</code><br>To remove the description, use the <code>no description {description}</code> command. |
| <b>Parameters</b>    | <b>description</b> Enter a description regarding this session (80 characters maximum).                                          |
| <b>Defaults</b>      | none                                                                                                                            |
| <b>Command Modes</b> | CONFIGURATION                                                                                                                   |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                          |
|-------------|--------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.          |
| 9.5(0.0)    | Introduced on the Z9500.             |
| 9.0.2.0     | Introduced on the S6000.             |
| 8.3.19.0    | Introduced on the S4820T.            |
| 8.3.11.1    | Introduced on the Z9000.             |
| 8.3.7.0     | Introduced on the S4810.             |
| 8.1.1.0     | Introduced on the E-Series ExaScale. |
| 7.7.1.0     | Introduced on the S-Series.          |
| 7.5.1.0     | Introduced on the C-Series.          |
| pre-7.7.1.0 | Introduced on the E-Series.          |

## Related Commands

[monitor session](#) — enables a monitoring session.

# monitor session

Create a session for monitoring traffic with port monitoring.

## Syntax

```
monitor session session-ID [type { rpm | erpm [set ip dscp dscp_value | set ip ttl ttl_value]}] [drop]
```

To delete a session, use the `no monitor session session-ID` command.

To delete all monitor sessions, use the `no monitor session all` command.

## Parameters

|                          |                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| <b><i>session-ID</i></b> | Enter a session identification number. The range is from 0 to 65535.                                  |
| <b>type</b>              | Specifies one of the following type: <ul style="list-style-type: none"><li>rpm</li><li>erpm</li></ul> |
| <b>rpm</b>               | Creates a remote port monitoring (rpm) session.                                                       |
| <b>erpm</b>              | Creates an encapsulated remote port monitoring (erpm) session.                                        |

|                    |                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>set ip dscp</b> | Configures the Differentiated Services Code Point (DSCP) value of the packets in the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default value, use the no form of this command. |
| <b>dscp_value</b>  | DSCP value of the packets in the ERSPAN traffic. The range is from 0 to 63. The default value is 0.                                                                                                                |
| <b>set ip ttl</b>  | Configures the IP time-to-live (TTL) value of the Encapsulated Remote Switched Port Analyzer (ERSPAN) traffic. To revert to the default configuration, use the no form of this command.                            |
| <b>ttl_value</b>   | IP TTL value of the ERSPAN traffic. The range is from 1 to 255. The default value is 255.                                                                                                                          |
| <b>drop</b>        | Monitors only the dropped packets in the Ingress.                                                                                                                                                                  |

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                 |
|----------|-------------------------------------------------------------------------------------------------------------|
| 9.8(0.0) | Added the drop parameter.                                                                                   |
| 9.7(0.0) | Introduced on the S6000-ON. Introduced the <code>set ip dscp</code> and <code>set ip ttl</code> parameters. |
| 9.5(0.1) | Introduced on the Z9500.                                                                                    |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000.                                                          |
| 9.0.2.0  | Introduced on the S6000.                                                                                    |
| 9.0.2.0  | Introduced on the MXL.                                                                                      |
| 8.3.11.1 | Introduced on the Z9000.                                                                                    |
| 8.3.7.0  | Introduced on the S4810.                                                                                    |

**Usage Information**

The `monitor` command is saved in the running configuration at Monitor Session mode level and can be restored after a chassis reload.

**Example**

```
Dell#show monitor session
  SessID  Source          Destination          Dir  Mode  Source
  IP      Dest IP         DSCP  TTL
  -----  -----
  0       Te 1/12         remote-ip           rx   Flow
  1.1.1.1 7.1.1.2         0      255
  0       Po 1            remote-ip           tx   Flow
  1.1.1.1 7.1.1.2         0      255
```

```

1 V1 11 remote-ip rx Flow
5.1.1.1 3.1.1.2 0 255

```

**Related Command**

[show monitor session](#) — displays the monitor session.

[show running-config monitor session](#) — displays the running configuration of a monitor session.

## rate-limit

Configure the rate-limit to limit the mirrored packets.

**Syntax**

`rate-limit limit`

To remove the limit, use the `no rate-limit limit` command.

**Parameters**

**limit**

Enter the rate-limit value. The range is from 0 to 40000 Megabits per second.

**Defaults**

60

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                                                     |
|----------|-----------------------------------------------------------------|
| 9.8(0.0) | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, Z9500. |

**Related Commands**

[monitor session](#) — enables a monitoring session.

[show monitor session](#) — displays the monitor session.

## show config

Display the current monitor session configuration.

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| <b>Syntax</b>        | <code>show config</code>                            |
| <b>Defaults</b>      | none                                                |
| <b>Command Modes</b> | MONITOR SESSION ( <i>conf-mon-sess-session-ID</i> ) |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 7.4.1.0  | Introduced on the E-Series.          |

**Example**

```
Dell(conf-mon-sess-1)#show config
!
monitor session 1
 source TenGigabitEthernet 1/1 destination Port-channel 1
 direction rx
```

## show monitor session

Display information about monitoring sessions.

**Syntax** `show monitor session {session-ID}`

To display monitoring information for all sessions, use the `show monitor session` command.

**Parameters**                    *session-ID*                    (OPTIONAL) Enter a session identification number. The range is from 0 to 65535.

**Defaults**                    none

- Command Modes**
- EXEC
  - EXEC Privilege

**Command History**                    This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.4.0.0  | Added support for the RPM / ERPM.    |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 7.4.1.0  | Introduced on the E-Series.          |

**Example**

```
Dell#show monitor session 1
SessID Source Destination Dir Mode Source IP Dest IP DSCP TTL
-----
-----
1 Te 1/2 remote-ip rx Port 0.0.0.0 0.0.0.0 0 0
Dell#show monitor session
SessID Source Destination Dir Mode Source IP Dest IP DSCP TTL
-----
-----
1 Te 1/2 remote-ip rx Port 0.0.0.0 0.0.0.0 0 255
99 NONE NONE N/A N/A N/A N/A N/A N/A
```

**Related Commands**

[monitor session](#) — creates a monitoring session.

[rate-limit](#) — configures the rate-limit.

# show running-config monitor session

Display the running configuration of all monitor sessions or a specific session.

**Syntax** `show running-config monitor session {session-ID}`  
To display the running configuration for all monitor sessions, use the `show running-config monitor session` command.

**Parameters** `session-ID` (OPTIONAL) Enter a session identification number. The range from 0 to 65535.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the S4810.             |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.5.1.0  | Introduced on the C-Series.          |
| 7.4.1.0  | Introduced on the E-Series.          |

**Usage Information** The `monitoring` command is saved in the running configuration at the Monitor Session mode level and can be restored after a chassis reload.

**Example**

```
Dell# show running-config monitor session
!
monitor session 1
source TenGigabitEthernet 1/1 destination TenGigabitEthernet
1/2 direction rx
!
monitor multicast-queue 7
```

Related  
Commands

[monitor session](#) — creates a monitoring session.

[show monitor session](#) — displays a monitoring session.

## source (port monitoring)

Configure a port monitor source.

**Syntax**

```
source {interface | range | any} destination interface  
direction {rx | tx | both}
```

To disable a monitor source, use the `no source interface destination interface direction {rx | tx | both}` command.

**Parameters**

**source  
*interface***

Enter one of the following keywords and slot/port information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface enter the keyword `VLAN` followed by a number from 1 to 4094.
- For a port channel interface, enter the keywords `port-channel` then a number.

**range**

Enter the keyword `range` to specify the list of interfaces.

**any**

Enter the keyword `any` to specify all interfaces.

**NOTE:** This option is applicable only with drop monitor session.

**destination**

Enter the keyword `destination` to specify the destination interface.

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

***interface***

Enter one of the following keywords and slot/port information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.
- For a port channel interface, enter the keywords `port-channel` then a number.

**direction {rx | tx | both}**

Enter the keyword `direction` then one of the packet directional indicators.

- `rx`: to monitor receiving packets only.
- `tx`: to monitor transmitting packets only.
- `both`: to monitor both transmitting and receiving packets.

**Defaults**

none

**Command Modes**

MONITOR SESSION (conf-mon- sess-session-ID)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.8(0.0) | Added the any parameter.                             |
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.5(0.1) | Introduced on the Z9500.                             |
| 9.4.0.0  | Added support for Source and destination.            |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.1.1.0  | Introduced on the E-Series ExaScale.                 |
| 7.7.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 7.4.1.0  | Introduced on the E-Series.                          |

**Example**

```
Dell# monitor session 0
source Port-channel 10 destination TenGigabitEthernet 1/33
direction tx
```

## Private VLAN (PVLAN)

The private VLAN (PVLAN) feature of the Dell Networking operating software is supported on the S4820T platforms.

Private VLANs extend the Dell Networking OS security suite by providing Layer 2 isolation between ports within the same private VLAN. A private VLAN partitions a traditional VLAN into subdomains identified by a primary and secondary VLAN pair. The Dell Networking OS private VLAN implementation is based on RFC 3069.

For more information, refer to the following commands. The command output is augmented in Dell Networking OS version 7.8.1.0 at later to provide PVLAN data:

- [show arp](#)
- [show vlan](#)

## Private VLAN Concepts

### Primary VLAN:

The primary VLAN is the base VLAN and can have multiple secondary VLANs. There are two types of secondary VLAN — community VLAN and isolated VLAN:

- A primary VLAN can have any number of community VLANs and isolated VLANs.
- Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports or trunk ports.

### Community VLAN:

A community VLAN is a secondary VLAN of the primary VLAN:

- Ports in a community VLAN can talk to each other. Also, all ports in a community VLAN can talk to all promiscuous ports in the primary VLAN and vice versa.
- Devices on a community VLAN can communicate with each other using member ports, while devices in an isolated VLAN cannot.

### Isolated VLAN:

An isolated VLAN is a secondary VLAN of the primary VLAN:

- Ports in an isolated VLAN cannot talk to each other. Servers would be mostly connected to isolated VLAN ports.
- Isolated ports can talk to promiscuous ports in the primary VLAN, and vice versa.

## Port Types:

- *Community port*: A community port is a port that belongs to a community VLAN and is allowed to communicate with other ports in the same community VLAN and with promiscuous ports.
- *Isolated port*: An isolated port is a port that, in Layer 2, can only communicate with promiscuous ports that are in the same PVLAN.
- *Promiscuous port*: A promiscuous port is a port that is allowed to communicate with any other port type.
- *Trunk port*: A trunk port carries VLAN traffic across switches:
  - A trunk port in a PVLAN is always tagged.
  - A trunk port in Tagged mode carries primary or secondary VLAN traffic. The tag on the packet helps identify the VLAN to which the packet belongs.
  - A trunk port can also belong to a regular VLAN (non-private VLAN).

## ip local-proxy-arp

Enable/disable Layer 3 communication between secondary VLANs in a private VLAN.

### S4820T

#### Syntax

```
[no] ip local-proxy-arp
```

To disable Layer 3 communication between secondary VLANs in a private VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the primary VLAN.

To disable Layer 3 communication in a particular secondary VLAN, use the `no ip local-proxy-arp` command in INTERFACE VLAN mode for the selected secondary VLAN.

**NOTE:** Even after you disable `ip-local-proxy-arp` (use `no ip-local-proxy-arp`) in a secondary VLAN, Layer 3 communication may happen between some secondary VLAN hosts, until the address resolution protocol (ARP) timeout happens on those secondary VLAN hosts.

#### Defaults

Layer 3 communication is disabled between secondary VLANs in a private VLAN.

#### Command Modes

INTERFACE VLAN

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

#### Related Commands

[private-vlan mode](#) — sets the mode of the selected VLAN to community, isolated, or primary.

[private-vlan mapping secondary-vlan](#) — maps secondary VLANs to the selected primary VLAN.

[show arp](#) — displays the ARP table.

[switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

## private-vlan mode

Set PVLAN mode of the selected VLAN to community, isolated, or primary.

### S4820T

#### Syntax

```
[no] private-vlan mode {community | isolated | primary}
```

To remove the PVLAN configuration, use the `no private-vlan mode {community | isolated | primary} command` syntax.

#### Parameters

|                  |                                                                                    |
|------------------|------------------------------------------------------------------------------------|
| <b>community</b> | Enter the keyword <code>community</code> to set the VLAN as a community VLAN.      |
| <b>isolated</b>  | Enter the keyword <code>isolated</code> to configure the VLAN as an isolated VLAN. |
| <b>primary</b>   | Enter the keyword <code>primary</code> to configure the VLAN as a primary VLAN.    |

#### Defaults

none

#### Command Modes

INTERFACE VLAN

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## Usage Information

The VLAN:

- can be in only one mode, either `community`, `isolated`, or `primary`.
- mode `ode` to `community` or `isolated` even before associating it to a primary VLAN. This secondary VLAN continues to work normally as a normal VLAN even though it is not associated to a primary VLAN. (A syslog message indicates this.)
- must not have a port in it when VLAN mode is being set.

Only ports (and port channels) configured as promiscuous, host, or PVLAN trunk ports (as previously described) can be added to the PVLAN. No other regular ports can be added to the PVLAN.

After using this command to configure a VLAN as a primary VLAN, use the `private-vlan mapping secondary-vlan` command to map secondary VLANs to this VLAN.

## Related Commands

[private-vlan mapping secondary-vlan](#) — maps secondary VLANs to the selected primary VLAN.

[switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

# private-vlan mapping secondary-vlan

Map secondary VLANs to the selected primary VLAN.

## S4820T

**Syntax** `[no] private-vlan mapping secondary-vlan vlan-list`

To remove specific secondary VLANs from the configuration, use the `no private-vlan mapping secondary-vlan vlan-list` command syntax.

#### Parameters

***vlan-list*** Enter the list of secondary VLANs to associate with the selected primary VLAN. The list can be in comma-delimited or hyphenated-range format, following the convention for the range input.

#### Defaults

none

#### Command Modes

INTERFACE VLAN

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

#### Usage Information

The list of secondary VLANs can be:

- Specified in comma-delimited or hyphenated-range format.
- Specified with this command even before they have been created.
- Amended by specifying the new secondary VLAN to be added to the list.

#### Related Commands

[private-vlan mode](#) — sets the mode of the selected VLAN to community, isolated, or primary.

[switchport mode private-vlan](#) — sets PVLAN mode of the selected port.

# switchport mode private-vlan

Set PVLAN mode of the selected port.

## S4820T

**Syntax** [no] switchport mode private-vlan {host | promiscuous | trunk}  
To remove PVLAN mode from the selected port, use the `no switchport mode private-vlan` command.

**Parameters**

|                    |                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>host</b>        | Enter the keyword <code>host</code> to configure the selected port or port channel as an isolated interface in a PVLAN. |
| <b>promiscuous</b> | Enter the keyword <code>promiscuous</code> to configure the selected port or port channel as a promiscuous interface.   |
| <b>trunk</b>       | Enter the keyword <code>trunk</code> to configure the selected port or port channel as a trunk port in a PVLAN.         |

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

**Usage Information** The assignment of the various PVLAN port types to port and port channel (LAG) interfaces is shown in the following example.

**Example**

```
Dell#conf
Dell(conf)#interface TenGigabitEthernet 2/1
Dell(conf-if-te-2/1)#switchport mode private-vlan promiscuous

Dell(conf)#interface TenGigabitEthernet 2/2
Dell(conf-if-te-2/2)#switchport mode private-vlan host

Dell(conf)#interface TenGigabitEthernet 2/3
```

```
Dell(conf-if-te-2/3)#switchport mode private-vlan trunk
Dell(conf)#interface port-channel 10
Dell(conf-if-te-2/3)#switchport mode private-vlan promiscuous
```

**Related  
Commands**

[private-vlan mode](#) — sets the mode of the selected VLAN to community, isolated, or primary.

[private-vlan mapping secondary-vlan](#) — sets the mode of the selected VLAN to primary and then associates the secondary VLANs to it.

# Per-VLAN Spanning Tree Plus (PVST+)

The Dell Networking operating software implementation of per-VLAN spanning tree plus (PVST+) is based on the IEEE 802.1w standard spanning tree protocol.

Dell Networking OS supports PVST+ on the S4820T platform.

 **NOTE:** For easier command line entry, the plus (+) sign is not used at the command line.

## description

Enter a description of the PVST+.

### S4820T

**Syntax** `description {description}`  
To remove the description, use the `no description {description}` command.

**Parameters** *description* Enter a description to identify the spanning tree (80 characters maximum).

**Defaults** none

**Command Modes** SPANNING TREE PVST+ (The prompt is "config-pvst".)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version      | Description              |
|--------------|--------------------------|
| 8.3.7.0      | Introduced on the S4810. |
| pre- 7.7.1.1 | Introduced.              |

**Related  
Commands**

[protocol spanning-tree pvst](#) — enter SPANNING TREE mode on the switch.

## disable

Disable PVST+ globally.

### S4820T

**Syntax**

`disable`

To enable PVST+, use the `no disable` command.

**Defaults**

Disabled.

**Command  
Modes**

CONFIGURATION (conf-pvst)

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.6.1.0      | Introduced on the S-Series. |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Related  
Commands**

[protocol spanning-tree pvst](#) — enter PVST+ mode.

## extend system-id

To augment the Bridge ID with a VLAN ID so that PVST+ differentiate between BPDUs for each VLAN, use extend system ID. If the VLAN receives a BPDU meant for another VLAN, PVST+ does not detect a loop, and both ports can remain in Forwarding state.

### S4820T

**Syntax** extend system-id

**Defaults** Disabled

**Command Modes** PROTOCOL PVST

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.3.1.0  | Introduced.                 |

### Example

```
Dell(conf-pvst)#do show spanning-tree pvst vlan 5 brief
VLAN 5
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 32773, Address 0001.e832.73f7

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>protocol spanning-tree pvst</code><br>To disable PVST+, use the <code>disable</code> command.                                                            |
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 8.3.1.0  | Introduced.                 |

### Example

```
Dell#conf
Dell(conf)#protocol spanning-tree pvst
Dell(conf-pvst)#no disable
Dell(conf-pvst)#vlan 2 bridge-priority 4096
Dell(conf-pvst)#vlan 3 bridge-priority 16384
Dell(conf-pvst)#
Dell(conf-pvst)#show config
!
protocol spanning-tree pvst
  no disable
  vlan 2 bridge-priority 4096
  vlan 3 bridge-priority 16384
Dell#
```

**Usage Information**

After you enable PVST+, the device runs an STP instance for each VLAN it supports.

**Related Commands**

[disable](#) — disables PVST+.

[show spanning-tree pvst](#) — displays the PVST+ configuration.

## show spanning-tree pvst

View the Per-VLAN spanning tree configuration.

### S4820T

**Syntax**

```
show spanning-tree pvst [vlan vlan-id] [brief] [guard]
```

**Parameters**

- vlan *vlan-id*** (OPTIONAL) Enter the keyword `vlan` then the VLAN ID. The range is 1 to 4094.
- brief** (OPTIONAL) Enter the keyword `brief` to view a synopsis of the PVST+ configuration information.
- interface*** (OPTIONAL) Enter one of the interface keywords along with the slot/port information:
- For a Port Channel interface, enter the keyword `port-channel` then a number: The range is 1 to 128.
  - For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- guard** (OPTIONAL) Enter the keyword `guard` to display the type of guard enabled on a PVST interface and the current port state.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                              |
|----------|--------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                              |
| 9.2(1.0) | Introduced on the Z9500.                                                                                                 |
| 9.0.2.0  | Introduced on the S6000.                                                                                                 |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                 |
| 8.3.7.0  | Introduced on the S4810.                                                                                                 |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                                                     |
| 8.4.2.1  | Support for the optional <code>guard</code> keyword was added on the C-Series, S-Series, and E-Series TeraScale.         |
| 7.6.1.0  | Introduced on the S-Series.                                                                                              |
| 7.5.1.0  | Introduced on the C-Series.                                                                                              |
| 6.4.1.0  | Expanded to display port error disable state (EDS) caused by loopback BPDU inconsistency and Port VLAN ID inconsistency. |
| 6.2.1.1  | Introduced.                                                                                                              |

#### Usage Information

The following describes the `show spanning-tree pvst` command shown in the following examples.

| Field                 | Description                                                                                                             |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | PVST interface.                                                                                                         |
| <b>Instance</b>       | PVST instance.                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

#### Example (Brief)

```
Dell#show spanning-tree pvst vlan 3 brief
VLAN 3
Executing IEEE compatible Spanning Tree Protocol
Root ID Priority 4096, Address 0001.e801.6aa8
Root Bridge hello time 2, max age 20, forward delay 15
Bridge ID Priority 16384, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15

Interface                               Designated

### Example

```
Dell#show spanning-tree pvst vlan 2
VLAN 2
Root Identifier has priority 4096, Address 0001.e805.e306
Root Bridge hello time 2, max age 20, forward delay 15
Bridge Identifier has priority 4096, Address 0001.e805.e306
Configured hello time 2, max age 20, forward delay 15
We are the root of VLAN 2
Current root has priority 4096, Address 0001.e805.e306
Number of topology changes 3, last change occurred 00:57:00

Port 130 (TenGigabitEthernet 1/4) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier
128.130
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.130, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 3
The port is not in the Edge port mode

Port 131 (TenGigabitEthernet 1/1) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier
128.131
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.131, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1567, received 0
The port is not in the Edge port mode

Port 146 (TenGigabitEthernet 1/16) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier
128.146
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.146, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1578, received 0
The port is in the Edge port mode

Port 147 (TenGigabitEthernet 1/17) is designated Forwarding
Port path cost 20000, Port priority 128, Port Identifier
128.147
Designated root has priority 4096, address 0001.e805.e3:06
Designated bridge has priority 4096, address 0001.e805.e3:06
Designated port id is 128.147, designated path cost 0
Number of transitions to forwarding state 1
BPDU sent 1579, received 0
The port is in the Edge port mode
```

### Example (EDS/ LBK)

```
Dell#show spanning-tree pvst vlan 2 interface
tengigabitethernet 1/1
```

**TenGigabitEthernet 1/1 of VLAN 2 is LBK\_INC discarding**

```
Edge port:no (default) port guard :none (default)
Link type: point-to-point (auto) bpdu filter:disable (default)
Bpdu guard :disable (default)
Bpdus sent 152, received 27562
```

Interface Designated

| Name   | PortID   | Prio | Cost  | Sts | Cost | Bridge ID            | PortID   |
|--------|----------|------|-------|-----|------|----------------------|----------|
| Te 1/1 | 128.1223 | 128  | 20000 | EDS | 0    | 32768 0001.e800.a12b | 128.1223 |

**Example (EDS/  
PVID)**

```
Dell#show spanning-tree pvst vlan 2 interface
tengigabitethernet 1/1
```

**TenGigabitEthernet 1/1 of VLAN 2 is PVID\_INC discarding**

```
Edge port:no (default) port guard :none (default)
Link type: point-to-point (auto) bpdu filter:disable (default)
Bpdu guard :disable (default)
Bpdus sent 1, received 0
```

Interface Designated

| Name   | PortID   | Prio | Cost  | Sts | Cost | Bridge ID            | PortID   |
|--------|----------|------|-------|-----|------|----------------------|----------|
| Te 1/1 | 128.1223 | 128  | 20000 | EDS | 0    | 32768 0001.e800.a12b | 128.1223 |

**Example  
(Guard)**

```
Dell#show spanning-tree pvst vlan 5 guard
Interface
```

| Name   | Instance | Sts         | Guard type |
|--------|----------|-------------|------------|
| Te 1/1 | 5        | INCON(Root) | Rootguard  |
| Te 1/2 | 5        | FWD         | Loopguard  |
| Te 1/3 | 5        | EDS(Shut)   | Bpduguard  |

```
Dell#show spanning-tree pvst vlan 5 guard
Interface
```

| Name     | Instance | Sts         | Guard type |
|----------|----------|-------------|------------|
| Te 1/1/1 | 5        | INCON(Root) | Rootguard  |
| Te 1/2/1 | 5        | FWD         | Loopguard  |
| Te 1/3/1 | 5        | EDS(Shut)   | Bpduguard  |

**Related  
Commands**

[spanning-tree pvst](#) – configure PVST+ on an interface.

## spanning-tree pvst

Configure a PVST+ interface with one of these settings: edge port with optional bridge port data unit (BPDU) guard, port disablement if an error condition occurs, port priority or cost for a VLAN range, loop guard, or root guard.

### S4820T

#### Syntax

```
spanning-tree pvst {edge-port [bpduguard [shutdown-on-violation]] | err-disable | vlan vlan-range {cost number | priority value} | loopguard | rootguard}
```

#### Parameters

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>edge-port</b>              | Enter the keywords <code>edge-port</code> to configure the interface as a PVST+ edge port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>bpduguard</b>              | <p>Enter the keyword <code>portfast</code> to enable Portfast to move the interface into Forwarding mode immediately after the root fails.</p> <p>Enter the keyword <code>bpduguard</code> to disable the port when it receives a BPDU.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>shutdown-on-violation</b>  | (OPTIONAL) Enter the keywords <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>err-disable</b>            | Enter the keywords <code>err-disable</code> to enable the port to be put into the error-disable state (EDS) if an error condition occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>vlan <i>vlan-range</i></b> | Enter the keyword <code>vlan</code> then the VLAN numbers. The range is from 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cost <i>number</i></b>     | <p>Enter the keyword <code>cost</code> then the port cost value. The range is from 1 to 200000.</p> <p>Defaults:</p> <ul style="list-style-type: none"><li>• 100 Mb/s Ethernet interface = <b>200000</b>.</li><li>• 1-Gigabit Ethernet interface = <b>20000</b>.</li><li>• 10-Gigabit Ethernet interface = <b>2000</b>.</li><li>• Port Channel interface with one 100 Mb/s Ethernet = <b>200000</b>.</li><li>• Port Channel interface with one 1 Gigabit Ethernet = <b>20000</b>.</li><li>• Port Channel interface with one 10 Gigabit Ethernet = <b>2000</b>.</li><li>• Port Channel with two 1 Gigabit Ethernet = <b>18000</b>.</li><li>• Port Channel with two 10 Gigabit Ethernet = <b>1800</b>.</li><li>• Port Channel with two 100 Mbps Ethernet = <b>180000</b>.</li></ul> |

|                       |                                                                                                                                                   |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>priority value</b> | Enter the keyword <code>priority</code> then the Port priority value in increments of 16. The range is from 0 to 240. The default is <b>128</b> . |
| <b>loopguard</b>      | (C-, S-, and E-Series TeraScale only) Enter the keyword <code>loopguard</code> to enable loop guard on a PVST+ port or port-channel interface.    |
| <b>rootguard</b>      | (C-, S-, and E-Series TeraScale only) Enter the keyword <code>rootguard</code> to enable root guard on a PVST+ port or port-channel interface.    |

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>                                                                                                          |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                                                                                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                                                    |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                                                    |
| <b>8.4.2.1</b>  | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the E-Series TeraScale, C-Series, and S-Series. |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                                                    |
| <b>8.2.1.0</b>  | Introduced the hardware <code>shutdown-on-violation</code> option.                                                          |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                                                 |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                                                 |
| <b>7.4.1.0</b>  | Added the optional Bridge Port Data Unit (BPDU) guard.                                                                      |
| <b>6.2.1.1</b>  | Introduced.                                                                                                                 |

**Usage Information** The BPDU guard option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into the Error Disable state if a BPDU appears, and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on a PVST switch, immediately transitions to the forwarding state. Only ports connected to end-hosts should be configured as an edge port. Consider an edge port similar to a port with a spanning-tree portfast enabled.

If you do not enable `shutdown-on-violation`, BPDUs are still sent to the route process module (RPM) CPU.

You cannot enable `root guard` and `loop guard` at the same time on a port. For example, if you configure `loop guard` on a port on which `root guard` is already configured, the following error message is displayed: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

When used in a PVST+ network, `loop guard` is performed per-port or per-port channel at a VLAN level. If no BPDUs are received on a VLAN interface, the port or port-channel transitions to a Loop-Inconsistent (blocking) state only for this VLAN.

Enabling Portfast BPDUs guard and `loop guard` at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDUs guard and `loop guard` are both configured:

- If a BPDU is received from a remote device, BPDUs guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, `loop guard` places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

#### Example

```
Dell(conf-if-te-1/1)#spanning-tree pvst vlan 3 cost 1800
Dell(conf-if-te-1/1)#end
Dell(conf-if-te-1/1)#show config
!
interface TenGigabitEthernet 1/1
  no ip address
  switchport
  spanning-tree pvst vlan 3 cost 1800
  no shutdown
Dell(conf-if-te-1/1)#end

Dell#
```

#### Related Commands

[show spanning-tree pvst](#) — views the PVST+ configuration.

# spanning-tree pvst err-disable

Place ports in an Err-Disabled state if they receive a PVST+ BPDU when they are members an untagged VLAN.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.2.1.0  | Introduced.                 |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | Some non-Dell Networking systems which have hybrid ports participating in PVST+ transmit two kinds of BPDUs: an 802.1D BPDU and an untagged PVST+ BPDU.<br><br>Dell Networking systems do not expect PVST+ BPDU on an untagged port. If this happens, Dell Networking OS places the port in the Error-Disable state. This behavior might result in the network not converging. To prevent Dell Networking OS from executing this action, use the <code>no spanning-tree pvst err-disable</code> command <code>cause invalid-pvst-bpdu</code> . |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                         |                                                                          |
|-------------------------|--------------------------------------------------------------------------|
| <b>Related Commands</b> | <a href="#">show spanning-tree pvst</a> — views the PVST+ configuration. |
|-------------------------|--------------------------------------------------------------------------|

# tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

## S4820T

**Syntax** `tc-flush-standard`  
To disable, use the `no tc-flush-standard` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced.                 |

**Usage Information** By default, Dell Networking OS implements an optimized flush mechanism for PVST+. This implementation helps in flushing the MAC addresses only when necessary (and less often) allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn this *knob* command on to enable flushing MAC addresses after receiving every topology change notification.

# vlan bridge-priority

Set the PVST+ bridge-priority for a VLAN or a set of VLANs.

## S4820T

### Syntax

```
vlan vlan-range bridge-priority value
```

To return to the default value, use the `no vlan bridge-priority` command.

### Parameters

|                                     |                                                                                                                                                                   |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-range</i></b>       | Enter the keyword <code>vlan</code> then the VLAN numbers. The range is from 1 to 4094.                                                                           |
| <b>bridge-priority <i>value</i></b> | Enter the keywords <code>bridge-priority</code> then the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is <b>32768</b> . |

### Defaults

**32768**

### Command Modes

CONFIGURATION (conf-pvst)

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced.                 |

### Related Commands

[vlan forward-delay](#) — changes the time interval before Dell Networking OS transitions to the Forwarding state.

[vlan hello-time](#) — change the time interval between BPDUs.

[vlan max-age](#) — changes the time interval before PVST+ refreshes.

[show spanning-tree pvst](#) — displays the PVST+ configuration.

# vlan forward-delay

Set the amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

## S4820T

### Syntax

```
vlan vlan-range forward-delay seconds
```

To return to the default setting, use the `no vlan forward-delay` command.

### Parameters

**vlan *vlan-range*** Enter the keyword `vlan` then the VLAN numbers. The range is from 1 to 4094.

**forward-delay *seconds*** Enter the keywords `forward-delay` then the time interval, in seconds, that Dell Networking OS waits before transitioning PVST+ to the forwarding state. The range is from 4 to 30 seconds. The default is **15 seconds**.

### Defaults

**15 seconds**

### Command Modes

CONFIGURATION (conf-pvst)

[vlan hello-time](#) — changes the time interval between BPDUs.

[vlan max-age](#) — changes the time interval before PVST+ refreshes.

[show spanning-tree pvst](#) — displays the PVST+ configuration.

## vlan hello-time

Set the time interval between generation of PVST+ 7 BPDUs.

### S4820T

#### Syntax

```
vlan vlan-range hello-time seconds
```

To return to the default value, use the `no vlan hello-time` command.

#### Parameters

|                                  |                                                                                                                                                                                    |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-range</i></b>    | Enter the keyword <code>vlan</code> then the VLAN numbers. The range is from 1 to 4094.                                                                                            |
| <b>hello-time <i>seconds</i></b> | Enter the keywords <code>hello-time</code> then the time interval, in seconds, between transmission of BPDUs. The range is from 1 to 10 seconds. The default is <b>2 seconds</b> . |

#### Defaults

**2 seconds**

#### Command Modes

CONFIGURATION (conf-pvst)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

[vlan max-age](#) — changes the time interval before PVST+ refreshes.

[show spanning-tree pvst](#) — displays the PVST+ configuration.

## vlan max-age

To maintain configuration information before refreshing that information, set the time interval for the PVST+ bridge.

### S4820T

#### Syntax

```
vlan vlan-range max-age seconds
```

To return to the default, use the `no vlan max-age` command.

#### Parameters

|                               |                                                                                                                                                                                                                              |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vlan <i>vlan-range</i></b> | Enter the keyword <code>vlan</code> then the VLAN numbers. The range is from 1 to 4094.                                                                                                                                      |
| <b>max-age <i>seconds</i></b> | Enter the keywords <code>max-age</code> then the time interval, in seconds, that Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is <b>20 seconds</b> . |

# Quality of Service (QoS)

The Dell Networking operating software commands for quality of service (QoS) include traffic conditioning and congestion control. QoS commands are not universally supported on all Dell Networking Products. S4820T platform.

This chapter contains the following sections:

- [Global Configuration Commands](#)
- [Per-Port QoS Commands](#)
- [Policy-Based QoS Commands](#)

## Global Configuration Commands

There is only one global configuration QoS command.

### qos-rate-adjust

By default, while rate limiting, policing, and shaping, Dell Networking OS does not include the Preamble, SFD, or the IFG fields. These fields are overhead; only the fields from MAC destination address to the CRC are used for forwarding and are included in these rate metering calculations. You can optionally include overhead fields in rate metering calculations by enabling QoS Rate Adjustment.

#### S4820T

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>qos-rate-adjustment <i>overhead-bytes</i></code>                                                                                                                                                                                                          |
| <b>Parameters</b>      | <p><b><i>overhead-bytes</i></b>      Include a specified number of bytes of packet overhead to include in rate limiting, policing, and shaping calculations. The range is from 1 to 31.</p>                                                                     |
| <b>Defaults</b>        | QoS rate adjustment is disabled by default.                                                                                                                                                                                                                     |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                   |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 8.3.1.0  | Introduced.                 |

## Per-Port QoS Commands

Per-port QoS (port-based QoS) allows you to define the QoS configuration on a per-physical-port basis.

### dot1p-priority

Assign a value to the IEEE 802.1p bits on the traffic this interface receives.

#### Syntax

`dot1p-priority priority-value`

To delete the IEEE 802.1p configuration on the interface, use the `no dot1p-priority` command.

#### Parameters

***priority-value*** Enter a value from 0 to 7.

| dot1p | Queue Number |
|-------|--------------|
| 0     | 0            |
| 1     | 0            |
| 2     | 0            |
| 3     | 1            |
| 4     | 2            |
| 5     | 3            |
| 6     | 3            |
| 7     | 3            |

#### Defaults

none

#### Command Modes

INTERFACE

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.5.1.0      | Introduced on the C-Series. |
| pre- 6.1.1.1 | Introduced on the E-Series. |

## Usage Information

The `dot1p-priority` command changes the priority of incoming traffic on the interface. The system places traffic marked with a priority in the correct queue and processes that traffic according to its queue.

When you set the priority for a port channel, the physical interfaces assigned to the port channel are configured with the same value. You cannot assign the `dot1p-priority` command to individual interfaces in a port channel.

## rate police

Police the incoming traffic rate on the selected interface.

### S4820T

#### Syntax

```
rate police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]] [vlan vlan-id]
```

#### Parameters

|                       |                                                                                                                                                                                      |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>kbps</b>           | Enter the keyword <code>kbps</code> to specify the rate limit in Kilobits per second (Kbps). The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps). |
| <b>committed-rate</b> | Enter the bandwidth in Mbps. The range is from 0 to 40000.                                                                                                                           |
| <b>burst-KB</b>       | (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is <b>50</b> .                                                                                    |
| <b>peak peak-rate</b> | (OPTIONAL) Enter the keyword <code>peak</code> then a number to specify the peak rate in Mbps. The range is from 0 to 40000.                                                         |
| <b>vlan vlan-id</b>   | (OPTIONAL) Enter the keyword <code>vlan</code> then a VLAN ID to police traffic to those specific VLANs. The range is from 1 to 4094.                                                |

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Granularity for <code>committed-rate</code> and <code>peak-rate</code> is Mbps unless you use the <code>kbps</code> option.                                    |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information**

**NOTE:** Per Port rate police is supported for Layer 2 tagged and untagged switched traffic and for Layer 3 traffic. Per VLAN rate police is supported on only tagged ports with Layer 2 switched traffic.

**S-Series**

On one interface, you can configure the `rate police` command for a VLAN or you can configure the `rate police` command for an interface.

**rate shape**

Shape the traffic output on the selected interface.

**S4820T**

**Syntax**

`rate shape [kbps] rate [burst-KB]`

**Parameters**

|                 |                                                                                                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>kbps</b>     | Enter the keyword <code>kbps</code> to specify the rate limit in Kilobits per second (Kbps). On S-Series, make the value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps). |
| <b>rate</b>     | The range is from 10 to 40000.                                                                                                                                                                                                     |
| <b>burst-KB</b> | (OPTIONAL) Enter the burst size in KB. The range is from 0 to 10000. The default is <b>50</b> .                                                                                                                                    |

**Defaults**

Granularity for rate is **Mbps** unless you use the `kbps` option.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information** On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

**NOTE:** When packets of size greater than 7000 bytes are expected to be received from the network, Dell Networking recommends that you configure the burst value to be more than 175 KB if you configured the rate shape. Such a setting ensures proper bandwidth sharing across queues.

**Related Commands** [rate-shape](#) — shapes traffic output as part of the designated policy.

## service-class dot1p-mapping

Configure a service-class criterion based on a dot1p value.

### S4820T

**Syntax** `service-class dot1p-mapping {dot1p0 queue | dot1p1 queue | dot1p2 queue | dot1p3 queue | dot1p4 queue| dot1p5 queue | dot1p6 queue | dot1p7 queue}`

**Parameters** **queue** Enter a value from 0 to 7.

**Defaults** For each dot1p Priority, the default CoS queue value is:

- Dot1p Priority : 0 1 2 3 4 5 6 7
- Queue : 2 0 1 3 4 5 6 7

**Command Modes** CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information**

To apply dot1p-queue-mapping, use the `service-class dynamic dot1p` command.

**Related Commands**

[show qos dot1p-queue-mapping](#) – displays the dot1p priority to queue mapping on the switch.

## service-class dynamic dot1p

Honor all 802.1p markings on incoming switched traffic on an interface (from INTERFACE mode) or on all interfaces (from CONFIGURATION mode). A CONFIGURATION mode entry supersedes an INTERFACE mode entry.

### S4820T

**Syntax**

```
service-class dynamic dot1p
```

To return to the default setting, use the `no service-class dynamic dot1p` command.

**Defaults**

All dot1p traffic is mapped to Queue 0 unless you enable the `service-class dynamic dot1p` command. The default mapping is as follows:

| dot1p | Queue ID |
|-------|----------|
| 0     | 0        |
| 1     | 0        |
| 2     | 0        |
| 3     | 1        |
| 4     | 2        |
| 5     | 3        |
| 6     | 3        |
| 7     | 3        |

**Command Modes**

- INTERFACE
- CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information**

To honor all incoming 802.1p markings on incoming switched traffic on the interface, enter this command. By default, this facility is not enabled (that is, the 802.1p markings on incoming traffic are not honored).

You can apply this command on both physical interfaces and port channels. When you set the `service-class dynamic` for a port channel, the physical interfaces assigned to the port channel are automatically configured; you cannot assign the `service-class dynamic` command to individual interfaces in a port channel.

- All dot1p traffic is mapped to Queue 0 unless you enable the `service-class dynamic dot1p` command on an interface or globally.
- Layer 2 or Layer 3 service policies supersede dot1p service classes.

## strict-priority queue

Configure a unicast queue as a strict-priority (SP) queue.

### S4820T

**Syntax**

`strict-priority queue unicast number`

**Parameters**

**unicast *number*** Enter the keyword `unicast` then the queue number. The range is from 1 to 3.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

#### Usage Information

After you configure a unicast queue as strict-priority, that particular queue, on the entire chassis, is treated as a `strict-priority` queue. Traffic for a strict priority is scheduled before any other queues are serviced. For example, if you send 100% line rate traffic over the SP queue, it starves all other queues on the ports on which this traffic is flowing.

## Policy-Based QoS Commands

Policy-based traffic classification is handled with class maps. These maps classify unicast traffic into one of eight classes in S-Series or eight classes in case of S6000. Dell Networking OS enables you to match multiple class maps and specify multiple match criteria. Policy-based QoS is not supported on logical interfaces, such as port-channels, VLANs, or loopbacks.

### bandwidth-percentage

Assign a percentage of weight to the class/queue.

#### S4820T

##### Syntax

`bandwidth-percentage percentage`

To remove the bandwidth percentage, use the `no bandwidth-percentage` command.

##### Parameters

***percentage***

Enter the percentage assignment of bandwidth to the class/queue. The range is from 1 to 100% (granularity 1%).

##### Defaults

none

##### Command Modes

CONFIGURATION (conf-qos-policy-out)

##### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.1.9.0 | Introduced on the S4820T.   |
| 8.3.11.1  | Introduced on the Z9000.    |
| 8.3.7.0   | Introduced on the S4810.    |
| 6.2.1.1   | Introduced on the E-Series. |

#### Usage Information

The unit of bandwidth percentage is 1%. If the sum of the bandwidth percentages given to all eight classes exceeds 100%, the bandwidth percentage automatically scales down to 100%.

#### Related Commands

[qos-policy-output](#) – creates a QoS output policy.

## class-map

Create/access a class map. Class maps differentiate traffic so that you can apply separate quality-of-service policies to each class.

### S4820T

**Syntax** `class-map {match-all | match-any} class-map-name [cpu-qos] [layer2]`

#### Parameters

|                       |                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>match-all</b>      | Determines how packets are evaluated when multiple match criteria exist. Enter the keywords <code>match-all</code> to determine that the packets must meet all the match criteria in order to be a member of the class.             |
| <b>match-any</b>      | Determines how packets are evaluated when multiple match criteria exist. Enter the keywords <code>match-any</code> to determine that the packets must meet at least one of the match criteria in order to be a member of the class. |
| <b>class-map-name</b> | Enter a name of the class for the class map in a character format (32 character maximum).                                                                                                                                           |
| <b>cpu-qos</b>        | Enter the keyword <code>cpu-qos</code> to assign this Class Map to control plane traffic only (CoPP).                                                                                                                               |
| <b>layer2</b>         | Enter the keyword <code>layer2</code> to specify a Layer 2 Class Map. The default is <b>Layer 3</b> .                                                                                                                               |

**Defaults** Layer 3

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                          |
|----------|--------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                          |
| 9.0.2.0  | Introduced on the S6000.                                                             |
| 8.3.19.0 | Introduced on the S4820T.                                                            |
| 8.3.11.1 | Introduced on the Z9000.                                                             |
| 8.3.7.0  | Introduced on the S4810.                                                             |
| 8.2.1.0  | Class-map names can be 32 characters. Layer2 available on the C-Series and S-Series. |
| 7.6.1.0  | Introduced on the S-Series.                                                          |
| 7.5.1.0  | Introduced on the C-Series.                                                          |
| 7.4.1.0  | E-Series Only: Expanded to add support for Layer 2.                                  |

**Usage Information**

Packets arriving at the input interface are checked against the match criteria and configured using this command to determine if the packet belongs to that class. This command accesses CLASS-MAP mode, where the configuration commands include `thematch ip` and `match mac` options.

**Related Commands**

[ip access-list extended](#) – configures an extended IP ACL.

[ip access-list standard](#) – configures a standard IP ACL.

[match ip access-group](#) – configures the match criteria based on the access control list (ACL).

[match ip precedence](#) – identifies the IP precedence values as match criteria.

[match ip dscp](#) – configures the match criteria based on the DSCP value.

[match mac access-group](#) – configures a match criterion for a class map based on the contents of the designated MAC ACL.

[match mac dot1p](#) – configures a match criterion for a class map based on a dot1p value.

[match mac vlan](#) – configures a match criterion for a class map based on VLAN ID.

[service-queue](#) – assigns a class map and QoS policy to different queues.

[show qos class-map](#) — views the current class map information.

## clear qos statistics

Clear qos statistics clears statistics from show qos statistics.

### S4820T

| <b>Syntax</b>           | <code>clear qos statistics interface-name</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| 9.0.2.0                 | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| 8.3.18.0                | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| 8.3.11.1                | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| 8.3.7.0                 | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| <b>Related Commands</b> | <a href="#">show qos statistics</a> — displays the QoS statistics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

## description

Add a description to the selected policy map or QoS policy.

### S4820T

**Syntax** `description {description}`

To remove the description, use the `no description {description}` command.

#### Parameters

***description*** Enter a description to identify the policies (80 characters maximum).

#### Defaults

none

#### Command Modes

CONFIGURATION (policy-map-input and policy-map-output; conf-qos-policy-in and conf-qos-policy-out; wred)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| pre- 7.7.1.0 | Introduced.                 |

#### Related Commands

[policy-map-input](#) — creates an input policy map.

[qos-policy-output](#) — creates an output QoS-policy on the router.

[wred-profile](#) — creates a WRED profile.

## match ip access-group

Configure match criteria for a class map, based on the access control list (ACL).

 **NOTE:** IPv6 class-maps and IP-any class-maps do not match. This condition is true for IPv6 and IP-any class-maps on both ACLs as well as VLANs.

### S4820T

#### Syntax

```
match ip access-group access-group-name [set-ip-dscp value |  
set-color value]
```

To remove ACL match criteria from a class map, use the `no match ip access-group access-group-name [set-ip-dscp value | set-color value]` command.

#### Parameters

|                                 |                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>access-group-name</i></b> | Enter the ACL name whose contents are used as the match criteria in determining if packets belong to the class the class-map specifies.                                                               |
| <b><i>set-ip-dscp value</i></b> | (OPTIONAL) Enter the keywords <code>set-ip-dscp</code> then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.                                          |
| <b><i>set-color value</i></b>   | (Optional) Enter the keyword <code>set-color</code> followed by a color value. Traffic that fulfills the match criteria is marked with the color value that you specify. The default value is Yellow. |

#### Defaults

none

#### Command Modes

CLASS-MAP CONFIGURATION (`config-class-map`)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

#### Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria. For `class-map match-any`, a maximum of five ACL match criteria are allowed. For `class-map match-all`, only one ACL match criteria is allowed.

#### Related Commands

[class-map](#) — identifies the class map.

## match ip dscp

Use a differentiated services code point (DSCP) value as a match criteria.

### S4820T

#### Syntax

```
match {ip | ipv6 | ip-any} dscp dscp-list [set-ip-dscp value]
```

To remove a DSCP value as a match criteria, use the `no match {ip | ipv6 | ip-any} dscp dscp-list [[multicast] set-ip-dscp value]` command.

#### Parameters

|                          |                                                                                                                                                                                                 |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>                | Enter the keyword <code>ip</code> to support IPv4 traffic.                                                                                                                                      |
| <b>ipv6</b>              | Enter the keyword <code>ipv6</code> to support IPv6 traffic.                                                                                                                                    |
| <b>ip-any</b>            | Enter the keyword <code>ip-any</code> to support IPv4 and IPv6 traffic.                                                                                                                         |
| <b>dscp-list</b>         | Enter the IP DSCP values that is to be the match criteria. Separate values by commas — no spaces ( 1,2,3 ) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 63. |
| <b>set-ip-dscp value</b> | (OPTIONAL) Enter the keywords <code>set-ip-dscp</code> then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.                                    |

#### Defaults

none

CLASS-MAP CONFIGURATION (config-class-map)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                              |
|----------|------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                              |
| 9.5(0.0) | Added the <b>ipv6</b> and <b>ip-any</b> options on the Z9000, S6000, S4820T, S4810, MXL. |
| 9.0.2.0  | Introduced on the S6000.                                                                 |
| 8.3.19.0 | Introduced on the S4820T.                                                                |
| 8.3.11.1 | Introduced on the Z9000.                                                                 |
| 8.3.7.0  | Introduced on the S4810.                                                                 |

#### Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

The `match ip dscp` and `match ip precedence` commands are mutually exclusive.

Up to 64 IP DSCP values can be matched in one match statement. For example, to indicate IP DSCP values 0 1 2 3 4 5 6 7, enter either the `match ip dscp 0,1,2,3,4,5,6,7` or `match ip dscp 0-7` command.

**NOTE:** Only one of the IP DSCP values must be a successful match criterion, not all of the specified IP DSCP values must match.

#### Related Commands

[class-map](#) — identifies the class map.

## match ip precedence

Use IP precedence values as a match criteria.

### S4820T

#### Syntax

```
match {ip | ipv6 | ip-any} precedence ip-precedence-list [set-ip-dscp value]
```

To remove IP precedence as a match criteria, use the `no match {ip | ipv6 | ip-any} precedence ip-precedence-list [[multicast] set-ip-dscp value]` command.

#### Parameters

|                           |                                                                                                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip</b>                 | Enter the keyword <code>ip</code> to support IPv4 traffic.                                                                                                                                  |
| <b>ipv6</b>               | Enter the keyword <code>ipv6</code> to support IPv6 traffic.                                                                                                                                |
| <b>ip-any</b>             | Enter the keyword <code>ip-any</code> to support IPv4 and IPv6 traffic.                                                                                                                     |
| <b>ip-precedence-list</b> | Enter the IP precedence value(s) as the match criteria. Separate values by commas — no spaces ( 1,2,3 ) or indicate a list of values separated by a hyphen (1-3). The range is from 0 to 7. |
| <b>set-ip-dscp value</b>  | (OPTIONAL) Enter the keywords <code>set-ip-dscp</code> then the IP DSCP value. The matched traffic is marked with the DSCP value. The range is from 0 to 63.                                |

#### Defaults

none

#### Command Modes

CLASS-MAP CONFIGURATION (config-class-map)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                            |
|----------|----------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                            |
| 9.5(0.0) | Added support for the ipv6 and ip-any options on the Z9000, S6000, S4820T, S4810, MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                                               |
| 9.0.2.0  | Introduced on the S6000.                                                               |
| 8.3.19.0 | Introduced on the S4820T.                                                              |
| 8.3.11.1 | Introduced on the Z9000.                                                               |
| 8.3.7.0  | Introduced on the S4810.                                                               |

### Usage Information

To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

The `match ip precedence` command and the `match ip dscp` command are mutually exclusive.

Up to eight precedence values can be matched in one match statement. For example, to indicate the IP precedence values 0 1 2 3, enter either the `match ip precedence 0-3` or `match ip precedence 0,1,2,3` command.

**NOTE:** Only one of the IP precedence values must be a successful match criterion, not all of the specified IP precedence values must match.

### Related Commands

[class-map](#) — identifies the class map.

## match mac access-group

Configure a match criterion for a class map, based on the contents of the designated MAC ACL.

### S4820T

#### Syntax

```
match mac access-group {mac-acl-name}
```

#### Parameters

**mac-acl-name** Enter a MAC ACL name. Its contents is used as the match criteria in the class map.

#### Defaults

none

#### Command Modes

CLASS-MAP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information** To access this command, enter the `class-map` command. After the class map is identified, you can configure the match criteria.

**Related Commands** [class-map](#) — identifies the class map.

## match mac dot1p

Configure a match criterion for a class map based on a dot1p value.

### S4820T

**Syntax** `match mac dot1p {dot1p-list}`

**Parameters** **dot1p-list** Enter a dot1p value. The range is from 0 to 7.

**Defaults** none

**Command Modes** CLASS-MAP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

## policy-aggregate

Allow an aggregate method of configuring per-port QoS via policy maps. An aggregate QoS policy is part of the policy map (output) applied on an interface.

### S4820T

|               |                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>policy-aggregate <i>qos-policy-name</i></code><br>To remove a policy aggregate configuration, use the <code>no policy-aggregate <i>qos-policy-name</i></code> command. |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Parameters</b>        | <b><i>qos-policy-name</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Enter the name of the policy map in character format (32 characters maximum). |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| <b>Usage Information</b> | If the rate shape exists in both aggregate and per-queue qos-policy, minimum of 2 take effect. Some of all Queue-rate will not exceed aggregate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                               |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| <b>Usage Information</b> | The input policy map is used to classify incoming traffic to different flows using class-map, QoS policy, or incoming packets DSCP. This command enables Policy-Map-Input Configuration mode (conf-policy-map-in).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information** To assign traffic to different flows using QoS policy, use the Output Policy map. This command enables Policy-Map-Output Configuration mode (conf-policy-map-out).

**Related Commands**

- [service-queue](#) — assigns a class map and QoS policy to different queues.
- [policy-aggregate](#) — allows an aggregate method of configuring per-port QoS using policy maps.
- [service-policy output](#) — applies an output policy map to the selected interface.

## qos-policy-input

Create a QoS input policy on the router.

### S4820T

**Syntax** `qos-policy-input qos-policy-name cpu-qos | layer2`  
 To remove an existing input QoS policy from the router, use the `no qos-policy-input qos-policy-name cpu-qos | layer2` command.

**Parameters**

|                               |                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b><i>qos-policy-name</i></b> | Enter the name for the policy map in character format (32 characters maximum).                                   |
| <b>cpu-qos</b>                | (OPTIONAL) Enter the keyword <code>cpu-qos</code> keyword to assign this ACL to control plane traffic only.      |
| <b>layer2</b>                 | (OPTIONAL) Enter the keyword <code>layer2</code> to specify a Layer 2 Class Map. The default is <b>Layer 3</b> . |

**Defaults** **Layer 3**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

#### Usage Information

Use this command to specify the name of the input QoS policy. Once input policy is specified, rate-police can be defined. This command enables the qos-policy-input configuration mode— (conf-qos-policy-in).

When changing a Service-Queue configuration in a QoS policy map, all QoS rules are deleted and re-added automatically to ensure that the order of the rules is maintained. As a result, the Matched Packets value shown in the `show qos statistics` command is reset.

#### Related Commands

[rate police](#) — incoming traffic policing function.

## qos-policy-output

Create a QoS output policy.

### S4820T

#### Syntax

`qos-policy-output qos-policy-name`

To remove an existing output QoS policy, use the `no qos-policy-output qos-policy-name` command.

#### Parameters

***qos-policy-name*** Enter your output QoS policy name in character format (32 characters maximum).

#### Defaults

none

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

#### Usage Information

Use this command to specify the name of the output QoS policy. Once output policy is specified, rate-shape, scheduler strict, bandwidth-percentage, and WRED can be defined. This command enables the qos-policy-output configuration mode `-(conf-qos-policy-out)`.

#### Related Commands

[bandwidth-percentage](#) — assigns percentage of bandwidth to the class/queue.

[wred](#) — assigns yellow or green drop precedence.

## queue egress

Assign a WRED Curve to all eight egress Multicast queues or designate the percentage for the Multicast bandwidth queue.

#### Syntax

```
queue egress multicast linecard {slot number port-set number |
all} [wred-profile name | multicast-bandwidth percentage]
To return to the default, use the no queue egress multicast linecard
{slot number port-set number | all} [wred-profile name |
multicast-bandwidth percentage] command.
```

#### Parameters

|                                       |                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>linecard number</b>                | Enter the keyword <code>linecard</code> then the line card slot number.                                                                                                                                                                                                                                                                     |
| <b>port-set number</b>                | Enter the keywords <code>port-set</code> then the line card's port pipe. The range is from 0 or 1.                                                                                                                                                                                                                                          |
| <b>all</b>                            | Enter the keyword <code>all</code> to apply to all line cards.                                                                                                                                                                                                                                                                              |
| <b>wred-profile name</b>              | (OPTIONAL) Enter the keywords <code>wred-profile</code> then your WRED profile name in character format (16 character maximum). Or use one of the pre-defined WRED profile names.<br>Pre-defined Profiles: <code>wred_drop</code> , <code>wred-ge_y</code> , <code>wred-ge_g</code> , <code>wred_teng_y</code> , <code>wred_teng_g</code> . |
| <b>multicast-bandwidth percentage</b> | (OPTIONAL) Enter the keywords <code>multicast-bandwidth</code> then the bandwidth percentage. The range is from 0 to 100%.                                                                                                                                                                                                                  |

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version                    | Description                            |
|----------------------------|----------------------------------------|
| <b>8.3.19.0</b>            | Introduced on the S4820T.              |
| <b>8.3.8.10</b>            | Introduced on the S4810.               |
| <b>7.5.1.0</b>             | Added support for multicast-bandwidth. |
| <b>7.4.1.0 and 6.5.3.0</b> | Introduced on the E-Series.            |

|                          |                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | This command does not uniquely identify a queue, but rather identifies only a set of queues. The WRED curve is applied to all eight egress Multicast queues. |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### **Important Points to Remember — Multicast-Bandwidth Option**

- A unique multicast weighted fair queuing (WFQ) setting can be applied only on a per port-pipe basis. The minimum percentage of the multicast bandwidth assigned to any of the ports in the port-pipe takes effect for the entire port-pipe.
- If the percentage of multicast bandwidth is 0, control traffic going through multicast queues are dropped.
- The `no` form of the command without `multicast-bandwidth` and `wred-profile`, removes both the `wred-profile` and `multicast-bandwidth` configuration.
- On 10-Gigabit ports only, the multicast bandwidth option works only if the total unicast bandwidth is more than the multicast bandwidth.
- If strict priority is applied along with `multicast-bandwidth`, the effect of strict priority is on all ports where unicast and multicast bandwidth are applied.
- When multicast bandwidth is assigned along with unicast bandwidth, first multicast bandwidth is reserved for that port, then the remaining unicast bandwidth configured is adjusted according to the bandwidth available after reserving for multicast bandwidth.

## **queue ingress**

Assign a WRED Curve to all eight ingress Multicast queues or designate the percentage for the Multicast bandwidth queue.

|               |                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>queue ingress multicast {linecard slot number port-set number   all} [wred-profile name]</code>                                               |
|               | To return to the default, use the <code>no queue ingress multicast {linecard slot number port-set number   all} [wred-profile name]</code> command. |

|                   |                              |                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>linecard<br/>number</b>   | Enter the keyword <code>linecard</code> then the line card slot number.                                                                                                                                                                                                                                                                         |
|                   | <b>port-set<br/>number</b>   | Enter the keywords <code>port-set</code> then the line card's port pipe. The range is from 0 or 1.                                                                                                                                                                                                                                              |
|                   | <b>all</b>                   | Enter the keyword <code>all</code> to apply to all line cards.                                                                                                                                                                                                                                                                                  |
|                   | <b>wred-profile<br/>name</b> | (OPTIONAL) Enter the keywords <code>wred-profile</code> then your WRED profile name in character format (16 character maximum). Or use one of the pre-defined WRED profile names.<br><br>Pre-defined Profiles: <code>wred_drop</code> , <code>wred-ge_y</code> , <code>wred-ge_g</code> , <code>wred_teng_y</code> , <code>wred_teng_g</code> . |

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                    | Description                 |
|----------------------------|-----------------------------|
| <b>8.3.19.0</b>            | Introduced on the S4820T.   |
| <b>8.3.8.0</b>             | Introduced on the S4810.    |
| <b>7.4.1.0 and 6.5.3.0</b> | Introduced on the E-Series. |

**Usage Information** This command does not uniquely identify a queue, but rather identifies only a set of queues. The WRED Curve is applied to all eight ingress Multicast queues.

**NOTE:** The `multicast-bandwidth` option is not supported on queue ingress. If you attempt to use the `multicast-bandwidth` option, the following reject error message is generated: `% Error:Bandwidth-percent is not allowed for ingress multicast.`

## rate-police

Specify the policing functionality on incoming traffic.

### S4820T

**Syntax** `rate-police [kbps] committed-rate [burst-KB] [peak [kbps] peak-rate [burst-KB]]`

## Parameters

|                              |                                                                                                                                                                                                                                 |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>kbps</b>                  | Enter the keyword <code>kbps</code> to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps). |
| <b><i>committed-rate</i></b> | Enter the bandwidth in Mbps. The range is from 0 to 40000.                                                                                                                                                                      |
| <b><i>burst-KB</i></b>       | (OPTIONAL) Enter the burst size in KB. The range is from 16 to 200000. The default is <b>100</b> .                                                                                                                              |
| <b><i>peak peak-rate</i></b> | (OPTIONAL) Enter the keyword <code>peak</code> then a number to specify the peak rate in Mbps. The range is from 0 to 40000. The default is the same as designated for <code>committed-rate</code> .                            |

## Defaults

Burst size is 100KB. `peak-rate` is by default the same as `committed-rate`. Granularity for `committed-rate` and `peak-rate` is Mbps unless you use the `kbps` option.

## Command Modes

QOS-POLICY-IN

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

## Usage Information

The default burst size is 100Kb. If a different value is required, you must configure the burst size to the required value.

## Related Commands

[rate police](#) — specifies traffic policing on the selected interface.

[qos-policy-input](#) — creates a QoS output policy.

## rate-shape

Shape traffic output as part of the designated policy.

### S4820T

#### Syntax

```
rate-shape [kbps] rate [burst-KB]
```

|                   |                 |                                                                                                                                                                                                                                 |
|-------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>kbps</b>     | Enter the keyword <code>kbps</code> to specify the rate limit in Kilobits per second (Kbps). Make the following value a multiple of 64. The range is from 0 to 40000000. The default granularity is Megabits per second (Mbps). |
|                   | <b>rate</b>     | The range is from 10 to 40000.                                                                                                                                                                                                  |
|                   | <b>burst-KB</b> | (OPTIONAL) Enter the burst size in KB. The range is from 0 to 40000. The default is <b>100</b> .                                                                                                                                |

**Defaults** Burst size is 10KB. Granularity for rate is Mbps unless you use the `kbps` option.

**Command Modes** QOS-POLICY-OUT

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information** On 40-port 10G stack-unit if the traffic is shaped between 64 and 1000 Kbs, for some values, the shaped rate is much less than the value configured.

**Related Commands** [rate shape](#) — shapes traffic output as part of the designated policy.  
[qos-policy-output](#) — creates a QoS output policy.

## service-policy input

Apply an input policy map to the selected interface.

### S4820T

**Syntax** `service-policy input policy-map-name [layer2]`  
 To remove the input policy map from the interface, use the `no service-policy input policy-map-name [layer2]` command.

**Parameters**

|                        |                                                                                                                                                             |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>policy-map-name</b> | Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist. |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|

**layer2** (OPTIONAL) Enter the keyword `layer2` to specify a Layer 2 Class Map. The default is **Layer 3**.

**Defaults**

**Layer 3**

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information**

You can attach a single policy-map to one or more interfaces to specify the service-policy for those interfaces. A policy map attached to an interface can be modified.

**NOTE:** The `service-policy` commands are not allowed on a port channel. The `service-policy input policy-map-name` command and the `service-class dynamic dot1p` command are not allowed simultaneously on an interface.

**Related Commands**

[policy-map-input](#) — creates an input policy map.

## service-policy output

Apply an output policy map to the selected interface.

### S4820T

**Syntax**

`service-policy output policy-map-name`

To remove the output policy map from the interface, use the `no service-policy output policy-map-name` command.

**Parameters**

***policy-map-name***

Enter the name for the policy map in character format (32 characters maximum). You can identify an existing policy map or name one that does not yet exist.

| <b>Defaults</b>          | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| 9.0.2.0                  | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| 8.3.19.0                 | Introduced on the S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| 8.3.11.1                 | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| 8.3.7.0                  | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| <b>Usage Information</b> | A single policy-map can be attached to one or more interfaces to specify the service-policy for those interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| <b>Related Commands</b>  | <a href="#">policy-map-output</a> — creates an output policy map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

## service-queue

Assign a class map and QoS policy to different queues.

### S4820T

**Syntax**

```
service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]
```

To remove the queue assignment, use the `no service-queue queue-id [class-map class-map-name] [qos-policy qos-policy-name]` command.

### Parameters

|                                   |                                                                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>queue-id</b>                   | Enter the value used to identify a queue. The range is from 0 to 7.                                                                                                              |
| <b>class-map class-map-name</b>   | (OPTIONAL) Enter the keyword <code>class-map</code> then the class map name assigned to the queue in character format (32 character maximum).                                    |
|                                   |  <b>NOTE:</b> This option is available under <code>policy-map-input</code> only.              |
| <b>qos-policy qos-policy-name</b> | (OPTIONAL) Enter the keywords <code>qos-policy</code> then the QoS policy name assigned to the queue in text format (32 characters maximum). This specifies the input QoS policy |

assigned to the queue under `policy-map-input` and output QoS policy under `policy-map-output` context.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION (conf-policy-map-in and conf-policy-map-out)                                                                                                     |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

|                          |                                                                                                                                                        |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | There are eight queues per interface on the S6000 and four queues on the S-Series. This command assigns a class map or QoS policy to different queues. |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

|                         |                                                                                                                                                                                                                                                           |

The range is from 0 to 63. | <b>mac-dot1p <i>value</i></b> | Enter the keywords <code>mac-dot1p</code> then the dot1p value. The range is from 0 to 7. |
| <b>ip-dscp <i>value</i></b>   | (OPTIONAL) Enter the keywords <code>ip-dscp</code> then the IP DSCP value. The range is from 0 to 63.                                                                                                                                                                                                                       |                             |                                                                                                       |                               |                                                                                           |
| <b>mac-dot1p <i>value</i></b> | Enter the keywords <code>mac-dot1p</code> then the dot1p value. The range is from 0 to 7.                                                                                                                                                                                                                                   |                             |                                                                                                       |                               |                                                                                           |
| <b>Defaults</b>               | none                                                                                                                                                                                                                                                                                                                        |                             |                                                                                                       |                               |                                                                                           |
| <b>Command Modes</b>          | CONFIGURATION (conf-qos-policy-in)                                                                                                                                                                                                                                                                                          |                             |                                                                                                       |                               |                                                                                           |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

## Usage Information

After the IP DSCP bit is set, other QoS services can then operate on the bit settings.

## show qos class-map

View the current class map information.

### S4820T

#### Syntax

```
show qos class-map [class-name]
```

#### Parameters

***class-name*** (Optional) Enter the name of a configured class map.

#### Defaults

none

#### Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

## Example

```
Dell#show qos class-map
```

```
Class-map match-any CM
  Match ip access-group ACL
```

**Related Commands** [class-map](#) — identifies the class map.

## show qos dot1p-queue-mapping

Displays the dot1p priority to queue mapping on the switch.

**Syntax** `show qos dot1p-queue-mapping`

**Defaults**

- Dot1p Priority : 0 1 2 3 4 5 6 7
- Queue : 0 0 0 1 2 3 3 3

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |

**Usage Information** trust dot1p, do1p-priority, service-class dynamic dot1; all these features work over the mapping in this command output.

**Related Commands** [service-class dot1p-mapping](#) — Identifies the class map.

## show qos policy-map

View the QoS policy map information.

### S4820T

**Syntax** `show qos policy-map {summary [interface] | detail}`

**Parameters**

|                  |                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>summary</b>   | To view a policy map interface summary, enter the keyword <code>summary</code> and optionally one of the following keywords and slot/port or number information:         |
| <b>interface</b> | <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li></ul> |

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**detail** To view a policy map interface in detail, enter the keyword `detail` and optionally one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Example (IPv4)**

```
Dell#show qos policy-map detail tengigabitethernet 1/1
Interface TeGigabitEthernet 4/1
Policy-map-input policy
Trust dffserv
Queue# Class-map-name Qos-policy-name
0 - q0
1 CM1 q1
2 CM2 q2
3 CM3 q3
Dell#
```

**Example (IPv6)**

```
Dell# show qos policy-map detail Tegigabitethernet 1/1
Interface TeGigabitEthernet 4/1
Policy-map-input pmap1
Queue# Class-map-name Qos-policy-name
0 c0 q0
1 c1 q1
```

```

2      c2      q2
3      c3      q3
Dell#

```

**Example  
(Summary IPv4)**

```

Dell#sho qos policy-map summary

Interface policy-map-input policy-map-output
Te 4/1      PM1      -
Te 4/2      PM2      PMOut
Dell#

```

## show qos policy-map-input

View the input QoS policy map details.

### S4820T

**Syntax** `show qos policy-map-input [policy-map-name] [class class-map-name] [qos-policy-input qos-policy-name]`

**Parameters**

|                                                |                                                                           |
|------------------------------------------------|---------------------------------------------------------------------------|
| <b><i>policy-map-name</i></b>                  | Enter the policy map name.                                                |
| <b><i>class class-map-name</i></b>             | Enter the keyword <code>class</code> then the class map name.             |
| <b><i>qos-policy-input qos-policy-name</i></b> | Enter the keyword <code>qos-policy-input</code> then the QoS policy name. |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |

**Example** `Dell#show qos policy-map-input`

```

Policy-map-input PolicyMapInput
Aggregate Qos-policy-name AggPolicyIn
Queue# Class-map-name Qos-policy-name
0 ClassMap1 qosPolicyInput
Dell#

```

## show qos policy-map-output

View the output QoS policy map details.

### S4820T

**Syntax** `show qos policy-map-output [policy-map-name] [qos-policy-output qos-policy-name]`

**Parameters**

|                                                 |                                                                            |
|-------------------------------------------------|----------------------------------------------------------------------------|
| <b><i>policy-map-name</i></b>                   | Enter the policy map name.                                                 |
| <b><i>qos-policy-output qos-policy-name</i></b> | Enter the keyword <code>qos-policy-output</code> then the QoS policy name. |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Example**

```

Dell#show qos policy-map-output

Policy-map-output PolicyMapOutput
Aggregate Qos-policy-name AggPolicyOut
Queue# Qos-policy-name
0 qosPolicyOutput
Dell#

```

## show qos qos-policy-input

View the input QoS policy details.

### S4820T

**Syntax** `show qos qos-policy-input [qos-policy-name]`

**Parameters**

|                               |                            |
|-------------------------------|----------------------------|
| <b><i>qos-policy-name</i></b> | Enter the QoS policy name. |
|-------------------------------|----------------------------|

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |

**Example**

```
Dell#show qos qos-policy-input
Qos-policy-input QosInput
    Rate-police 100 50 peak 100 50
    Dscp 32
Dell#
```

## show qos qos-policy-output

View the output QoS policy details.

### S4820T

**Syntax** `show qos qos-policy-output [qos-policy-name]`

**Parameters**

|                               |                            |
|-------------------------------|----------------------------|
| <b><i>qos-policy-name</i></b> | Enter the QoS policy name. |
|-------------------------------|----------------------------|

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Example**

```
Dell#show qos qos-policy-output
Qos-policy-output qosOut
    Rate-limit 50 50 peak 50 50
    Wred yellow 1
    Wred green 1
```

## show qos statistics

View QoS statistics.

### S4820T

**Syntax**

```
show qos statistics {egress-queue [interface]} | {wred-profile [interface]} | [interface]
```

**Parameters**

|                                      |                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>egress-queue interface</i></b> | Enter the keyword <i>egress-queue</i> to display the egress-queue statistics and optionally one of the following keywords and slot/port or number information. |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**wred-profile interface** Enter the keywords `wred-profile` and optionally one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**interface** Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                  |
|----------|----------------------------------------------|
| 9.8(0.0) | Added the <code>egress-queue</code> keyword. |
| 9.7(0.0) | Introduced on the S6000-ON.                  |
| 9.0.2.0  | Introduced on the S6000.                     |
| 8.3.19.0 | Introduced on the S4820T.                    |
| 8.3.11.1 | Introduced on the Z9000.                     |
| 8.3.7.0  | Introduced on the S4810.                     |

**Related Command** [clear hardware stack-unit](#) - Clear statistics from selected hardware components.

## show qos wred-profile

View the WRED profile details.

### S4820T

**Syntax** `show qos wred-profile wred-profile-name`

**Parameters**                    *wred-profile-name*                    Enter the WRED profile name to view the profile details.

**Defaults**                    none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**                    This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Example**

```
Dell#show qos wred-profile
Wred-profile-name  min-threshold  max-threshold  max-drop-
rate
wred_drop          0              0
100
wred_teng_y        467           4671
100
wred_teng_g        467           4671
50
wred_fortyg_y     467           4671
50
wred_fortyg_g     467           4671
25
```

## test cam-usage

Check the Input Policy Map configuration for the CAM usage.

### S4820T

**Syntax**                    `test cam-usage service-policy input policy-map stack-unit`  
`{[number port-set portpipe number] | [all]}`

**Parameters**

*policy-map*                    Enter the policy map name.

*stack-unitnumber*                    (OPTIONAL) Enter the keyword `stack-unit` then the stack-unit slot number.

**port-set** Enter the keywords `port-set` then the stack-unit port pipe number. The range is from 0 or 1.

**portpipe number**

**stack-unit all** (OPTIONAL) Enter the keywords `stack-unit all` to indicate all stack-unit.

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

**Usage Information** This feature allows you to determine if the CAM has enough space available before applying the configuration on an interface.

An input policy map with both Trust and Class-map configuration, the Class-map rules are ignored and only the Trust rule is programmed in the CAM. In such an instance, the Estimated CAM output column contains the size of the CAM space required for the Trust rule and not the Class-map rule.

The following describes the `test cam-usage service-policy input policy-map stack-unit` command shown in the following example.

| Field                | Description                                                                   |
|----------------------|-------------------------------------------------------------------------------|
| <b>stack-unit</b>    | Indicates the stack-unit slot number.                                         |
| <b>Portpipe</b>      | Indicates the portpipe number.                                                |
| <b>CAM Partition</b> | The CAM space where the rules are added.                                      |
| <b>Available CAM</b> | Indicates the free CAM space, in the partition, for the classification rules. |

**NOTE:** The CAM entries reserved for the default rules are not included in the Available CAM column; free entries, from the default rules space, cannot be used as a policy map for the classification rules.

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Estimated CAM per Port</b> | <p>Indicates the number of free CAM entries required (for the classification rules) to apply the input policy map on a single interface.</p> <p> <b>NOTE:</b> The CAM entries for the default rule are not included in this column; a CAM entry for the default rule is always dedicated to a port and is always available for that interface.</p>                                                                                                  |
| <b>Status (Allowed ports)</b> | <p>Indicates if the input policy map configuration on an interface belonging to a stack-unit/port-pipe is successful – Allowed (n) – or not successful – Exception. The allowed number (n) indicates the number of ports in that port-pipe on which the Policy Map can be applied successfully.</p> <p> <b>NOTE:</b> In a Layer 2 Policy Map, IPv4/IPv6 rules are not allowed; therefore, the output contains only L2ACL CAM partition entries.</p> |

**Example**

```
Dell# test cam-usage service-policy input pmap_l2 stack-unit all
```

For a L2 Input Policy Map pmap\_l2, the output must be as follows,

```
stack-unit|Portpipe|CAM Partition|Available CAM|Estimated CAM|
Status   |per Port  |
(Allowed ports)
0          0          L2ACL        500         200
Allowed (2)
0          1          L2ACL        100         200
Exception
1          0          L2ACL       1000         200
Allowed (5)
1          1          L2ACL         0          200
Exception
...
...
...
13         1          L2ACL        400         200
Allowed (2)
Dell#
```

**threshold**

Specify the minimum and maximum threshold values for the configured WRED profiles.

**S4820T**

**Syntax**                    `threshold min number max number max-drop-probability`

To remove the threshold values, use the `no threshold min number max number` command.

**Parameters**

- min number** Enter the keyword `min` then the minimum threshold number for the WRED profile. The range is from 1 to 9360.
- max-drop-probability number** Enter the keyword **max-drop-probability** followed by the maximum number of packets for the WRED profile. The range is from 0 to 100 KB

**Defaults**

none

**Command Modes**

CONFIGURATION (config-wred)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.8.0  | Introduced on the S4810.    |

**Usage Information**

To configure the minimum and maximum threshold values for user-defined profiles, use this command. Additionally, to modify the minimum and maximum threshold values for the pre-defined WRED profiles, use this command. If you delete the threshold values of the pre-defined WRED profiles, the profiles revert to their original default values.

| Pre-Defined WRED Profile Name | Minimum Threshold | Maximum Threshold |     |
|-------------------------------|-------------------|-------------------|-----|
| wred_drop                     | 0                 | 0                 | 100 |
| wred_ten_y                    | 467               | 4671              | 100 |
| wred_ten_g                    | 467               | 4671              | 50  |
| wred_fortyg_y                 | 467               | 4671              | 50  |
| wred_fortyg_g                 | 467               | 4671              | 25  |

**Related Commands**

[wred-profile](#) — creates a WRED profile.

## trust

Specify dynamic classification (DSCP) or dot1p to trust.

### S4820T

| <b>Syntax</b>            | <code>trust {diffserv [fallback]   dot1p [fallback]}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                 |                                                                            |              |                                                                            |                 |                                                                                                                                                                                     |          |                           |          |                          |         |                          |

## wred

Designate the WRED profile to yellow or green traffic.

### S4820T

#### Syntax

```
wred {yellow | green} profile-name
```

To remove the WRED drop precedence, use the `no wred {yellow | green} [profile-name]` command.

#### Parameters

##### **yellow | green**

Enter the keyword `yellow` for yellow traffic. A DSCP value of xxx110 and xxx100, xxx101 maps to yellow.

Enter the keyword `green` for `green` traffic. A DSCP value of xxx0xx are green and DSCP 111111 are red packets.

##### ***profile-name***

Enter your WRED profile name in character format (32 character maximum). Or use one of the five pre-defined WRED profile names.

Pre-defined Profiles: `wred_drop`, `wred-ge_y`, `wred-ge_g`, `wred_teng_y`, `wred_teng_g`.

| <b>Defaults</b>          | When WRED green is applied, default WRED yellow profiles take effect and vice-versa.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| <b>Usage Information</b> | To assign drop precedence to green or yellow traffic, use this command. If there is no honoring enabled on the input, all the traffic defaults to green drop precedence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

## wred ecn

To indicate network congestion, rather than dropping packets, use explicit congestion notification (ECN).

| Version  | Description               |
|----------|---------------------------|
| 9.0.2.0  | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820t. |
| 8.3.11.1 | Introduced on the Z9000.  |
| 8.3.7.0  | Introduced on the S4810.  |

### Usage Information

When you enable `wred ecn`, and the number of packets in the queue is below the minimum threshold, packets are transmitted per the usual WRED treatment.

When you enable `wred ecn`, and the number of packets in the queue is between the minimum threshold and the maximum threshold, one of the following two scenarios can occur:

- If the transmission endpoints are ECN-capable and traffic is congested, and the WRED algorithm determines that the packet should have been dropped based on the drop probability, the packet is transmitted and marked so the routers know the system is congested and can slow transmission rates.
- If neither endpoint is ECN-capable, the packet may be dropped based on the WRED drop probability. This behavior is the identical treatment that a packet receives when WRED is enabled without ECN configured on the router.

When you enable `wred ecn`, and the number of packets in the queue is above the maximum threshold, packets are dropped based on the drop probability. This behavior is the identical treatment a packet receives when WRED is enabled without ECN configured on the router.

### Related Commands

[wred-profile](#) — creates a WRED profile and name that profile.

## wred-profile

Create a WRED profile and name the profile.

### S4820T

#### Syntax

```
wred-profile wred-profile-name
```

To remove an existing WRED profile, use the `no wred-profile` command.

#### Parameters

##### **wred-profile-name**

Enter your WRED profile name in character format (32 character maximum). Or use one of the pre-defined WRED profile names. You can configure up to 26 WRED profiles plus the five pre-defined profiles, for a total of 31 WRED profiles.

Pre-defined Profiles: `wred_drop`, `wred-ge_y`, `wred_ge_g`, `wred_teng_y`, `wred_teng_g`.

| <b>Defaults</b>          | The five pre-defined WRED profiles. When you configure a new profile, the minimum and maximum threshold defaults to predefined <code>wred_ge_g</code> values. If green profile is applied, default yellow also take effect and vice-versa.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

| <b>Usage Information</b> | Use the default pre-defined profiles or configure your own profile. You cannot delete the pre-defined profiles or their default values. This command enables WRED configuration mode <code>—(conf-wred)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |
| <b>Related Commands</b>  | <a href="#">threshold</a> — specifies the minimum and maximum threshold values of the WRED profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |

## DSCP Color Map Commands

The DSCP color map allows you to set the number of specific DSCP values to yellow or red. Traffic marked as yellow delivers traffic to the egress queue which will either transmit the packet if it has available bandwidth or drop the packet due to no ability to send. Traffic marked as red (high drop precedence) is dropped.

### dscp

Sets the number of specific DSCP values for a color map profile to yellow or red.

|               |                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>dscp {yellow   red} [<i>list-dscp-values</i>]</pre> <p>To remove a color policy map profile, use the <code>no dscp {yellow   red} [<i>dscp-list</i>]</code> command.</p> |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Parameters

|                         |                                                                                                                                                                                                                                                                                             |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Yellow</b>           | Enter the <code>yellow</code> keyword. Traffic marked as yellow delivers traffic to the egress queue which either transmits the packet if it has available bandwidth or drops the packet due to no ability to send.                                                                         |
| <b>Red</b>              | Enter the <code>red</code> keyword. Traffic marked as red is dropped.                                                                                                                                                                                                                       |
| <b><i>dscp-list</i></b> | Enter a list of IP DSCP values. The <i>dscp-list</i> parameter specifies the full list of IP DSCP value(s) for the specified color. Each DSCP value in a list is separate values by commas – no spaces (1,2,3) or indicates a list of values separated by a hyphen (1-3). Range is 0 to 63. |

## Defaults

**None**

## Command Modes

CONFIG-COLOR-MAP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>                                      |
|-----------------|---------------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                             |
| <b>9.5.0.0</b>  | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

## Usage Information

If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).

The default setting for each DSCP value (0-63) is green (low drop precedence). This command allows setting the number of specific DSCP values to yellow or red.

### Important Points to Remember

- All DSCP values that are not specified as yellow or red are colored green.
- A DSCP value cannot be in both the yellow and red lists. Setting the red or yellow list with any DSCP value that is already in the other list results in an error and no update to that list is made.
- Each color map can only have one list of DSCP values for each color; any DSCP values previously listed for that color that are not in the new DSCP list are colored green.

## Example

```
Dell(conf-dscp-color-map)# dscp yellow 9,10,11,13,15,16
```

[qos dscp-color-policy](#)— configures a DSCP color policy

## qos dscp-color-map

Configure the DSCP color map.

| <b>Syntax</b>            | <code>qos dscp-color-map map-name</code><br>To remove a color map, use the <code>no qos dscp-color-map map-name</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |          |                             |         |                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|-----------------------------|---------|---------------------------------------------------------|
| <b>Parameters</b>        | <b>map-name</b> Enter the name of the DSCP color map. The map name can have a maximum of 32 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                                                         |
| <b>Defaults</b>          | <b>None</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |          |                             |         |                                                         |
| <b>Command Modes</b>     | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                             |         |                                                         |

| 9.7(0.0)                 | Introduced on the S6000-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |         |             |          |                             |         |                                                         |
| 9.5.0.0                  | Introduced on the Z9000, S6000, S4820T, S4810, and MXL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |         |                                                         |
| <b>Usage Information</b> | A color map outlines the codepoint mappings to the appropriate color mapping (green, yellow, red) for the traffic. The system uses this information use to handle the traffic on the interface based on the traffic priority and places it into the appropriate shaping queue. You cannot delete a DSCP color map when it is configured on an interface. If you do, all the DSCP values are set to green (low drop precedence). To delete the DSCP color map that is being used by one or more interfaces, remove the DSCP map from each interface. |         |             |          |                             |         |                                                         |
| <b>Example</b>           | <pre>Dell(conf)#qos dscp-color-map mymap</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                             |         |                                                         |
| <b>Related Commands</b>  | <p><a href="#">qos dscp-color-map</a>— associates the DSCP color map profile with an interface so that all IP packets received on it is given a color based on that color map</p> <p><a href="#">dscp</a>— sets the number of specific DSCP values for color map profile to yellow or red.</p>                                                                                                                                                                                                                                                      |         |             |          |                             |         |                                                         |

## qos dscp-color-policy

Associates the DSCP color map profile with an interface so that all IP packets received on it is given a color based on that color map.

**Syntax** `dscp-color-policy color-map-profile-name`  
To remove a color policy map profile, use the `no dscp-color-policy color-map-profile-name` command.

**Parameters**

|                                      |                                                                                 |
|--------------------------------------|---------------------------------------------------------------------------------|
| <b><i>color-map-profile-name</i></b> | Enter the color map profile name. The name can have a maximum of 32 characters. |
|--------------------------------------|---------------------------------------------------------------------------------|

**Defaults** **None**

**Command Modes** CONFIG-INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                             |
|-----------------|---------------------------------------------------------|
| 9.7(0.0)        | Introduced on the S6000-ON.                             |
| Version 9.5.0.0 | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Usage Information** If the specified color-map does not exist, the Diffserv Manager (DSM) creates a color map and sets all the DSCP values to green (low drop precedence).

**Example** The following example assigns the color map, **bat-enclave-map**, to interface **te 1/11**.

```
Dell(conf)# int te 1/11
Dell(conf-if-te-1/11)# qos dscp-color-policy bat-enclave-map
```

**Related Commands** [dscp](#)— sets the number of specific DSCP values for color map profile to yellow or red.

[qos dscp-color-map](#)— configures the DSCP color map.

## show qos dscp-color-policy

Display DSCP color policy configuration for one or all interfaces.

**Syntax** `show qos dscp-color-policy {summary [interface] | detail [interface]}`

**Parameters**

|                  |                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>summary</b>   | Enter the <code>summary</code> keyword to display summary information about a color policy on one or more interfaces. |
| <b>Detail</b>    | Enter the <code>detail</code> keyword to display detailed information about a color policy on one or more interfaces. |
| <b>interface</b> | Enter the name of the interface that has color policy configured.                                                     |

**Defaults** **None**

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                             |
|----------|---------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                             |
| 9.5.0.0  | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Example** Display summary information about a color policy on one or more interfaces.

```
Dell# show qos dscp-color-policy summary
```

```
Interface    dscp-color-map
TE 1/10      mapONE
TE 1/11      mapTWO
```

Display summary information about a color policy on a specific interface.

```
Dell# show qos dscp-color-policy summary te 1/10
Interface    dscp-color-map
TE 1/10      mapONE
```

Displayed detailed color policy information on an interface.

```
Dell# show qos dscp-color-policy detail te 1/10
Interface TenGigabitEthernet 1/10
```

```
Dscp-color-map mapONE
  yellow 4,7
  red 20,30
```

**Related  
Commands**

— Displays DSCP color maps [show qos dscp-color-map](#)

## show qos dscp-color-map

Display the DSCP color map for one or all interfaces.

**Syntax** `show qos dscp-color-map map-name`

**Parameters**

|                        |                                  |
|------------------------|----------------------------------|
| <b><i>map-name</i></b> | Enter the name of the color map. |
|------------------------|----------------------------------|

**Defaults** **None**

**Command  
Modes** EXEC

**Command  
History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                             |
|----------|---------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                             |
| 9.5.0.0  | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Example** Display all DSCP color maps.

```
Dell# show qos dscp-color-map
Dscp-color-map mapONE
  yellow 4,7
  red 20,30
Dscp-color-map mapTWO
  yellow 16,55
```

Display a specific DSCP color map.

```
Dell# show qos dscp-color-map mapTWO
Dscp-color-map mapTWO
  yellow 16,55
```

**Related  
Commands**

# Routing Information Protocol (RIP)

Routing information protocol (RIP) is a distance vector routing protocol. The Dell Networking operating software supports both RIP version 1 (RIPv1) and RIP version 2 (RIPv2) on the S4820T platform.

The Dell Networking OS implementation of RIP is based on IETF RFCs 2453 and RFC 1058. For more information about configuring RIP, refer to the *Dell Networking OS Configuration Guide*.

## auto-summary

Restore the default behavior of automatic summarization of subnet routes into network routes. This command applies only to RIP version 2.

**Syntax** `auto-summary`  
To send sub-prefix routing information, use the `no auto-summary` command.

**Defaults** Enabled.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

# clear ip rip

Update all the RIP routes in the Dell Networking OS routing table.

## S4820T

**Syntax** `clear ip rip`

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information** This command triggers updates of the main RIP routing tables.

# debug ip rip

Examine RIP routing information for troubleshooting.

## S4820T

**Syntax** `debug ip rip [interface | database | events [interface] | trigger]`

To turn off debugging output, use the `no debug ip rip` command.

**Parameters** *interface* (OPTIONAL) Enter the interface type and ID as one of the following:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

|                 |                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------|
| <b>database</b> | (OPTIONAL) Enter the keyword <code>database</code> to display messages when there is a change to the RIP database. |
| <b>events</b>   | (OPTIONAL) Enter the keyword <code>events</code> to debug only RIP protocol changes.                               |
| <b>trigger</b>  | (OPTIONAL) Enter the keyword <code>trigger</code> to debug only RIP trigger extensions.                            |

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>      | <b>Description</b>                                   |
|---------------------|------------------------------------------------------|
| <b>9.7(0.0)</b>     | Introduced on the S6000-ON.                          |
| <b>9.0.2.0</b>      | Introduced on the S6000.                             |
| <b>8.3.19.0</b>     | Introduced on the S4820T.                            |
| <b>8.3.11.1</b>     | Introduced on the Z9000.                             |
| <b>8.5.1.0</b>      | Added support for 4-port 40G line cards on ExaScale. |
| <b>8.3.7.0</b>      | Introduced on the S4810.                             |
| <b>7.8.1.0</b>      | Introduced on the S-Series.                          |
| <b>7.6.1.0</b>      | Introduced on the C-Series.                          |
| <b>pre- 6.2.1.1</b> | Introduced on the E-Series.                          |

# default-information originate

Generate a default route for the RIP traffic.

## S4820T

**Syntax** `default-information originate [always] [metric metric-value]  
[route-map map-name]`  
To return to the default values, use the `no default-information originate` command.

**Parameters**

|                                   |                                                                                                                                          |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>always</b>                     | (OPTIONAL) Enter the keyword <code>always</code> to enable the switch software to always advertise the default route.                    |
| <b>metric <i>metric-value</i></b> | (OPTIONAL) Enter the keyword <code>metric</code> then a number as the metric value. The range is from 1 to 16. The default is <b>1</b> . |
| <b>route-map <i>map-name</i></b>  | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of a configured route-map.                                            |

**Defaults** Disabled. Metric: **1**.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information** The default route must be present in the switch routing table for the `default-information originate` command to take effect.

# default-metric

Change the default metric for routes. To ensure that all redistributed routes use the same metric value, use this command with the `redistribute` command.

## S4820T

| <b>Syntax</b>            | <code>default-metric number</code><br>To return the default metric to the original values, use the <code>no default-metric</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |              |                             |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|-----------------------------|---------|--------------------------|----------|---------------------------|----------|--------------------------|---------|--------------------------|---------|-----------------------------|---------|-----------------------------|--------------|-----------------------------|
| <b>Parameters</b>        | <b>number</b> Specify a number. The range is from 1 to 16. The default is <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |              |                             |
| <b>Defaults</b>          | <b>1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |              |                             |

Enter a description of the RIP routing protocol.

## S4820T

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>description {description}</code><br>To remove the description, use the <code>no description {description}</code> command.                                                                                                                           |
| <b>Parameters</b>      | <b><i>description</i></b> Enter a description to identify the RIP protocol (80 characters maximum).                                                                                                                                                       |
| <b>Defaults</b>        | none                                                                                                                                                                                                                                                      |
| <b>Command Modes</b>   | ROUTER RIP                                                                                                                                                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |

| <b>Version</b> | <b>Description</b>          |
|----------------|-----------------------------|
| 9.7(0.0)       | Introduced on the S6000-ON. |
| 9.0.2.0        | Introduced on the S6000.    |
| 8.3.19.0       | Introduced on the S4820T.   |
| 8.3.11.1       | Introduced on the Z9000.    |
| 8.3.7.0        | Introduced on the S4810.    |
| 7.8.1.0        | Introduced on the S-Series. |
| 7.6.1.0        | Introduced on the C-Series. |
| pre- 7.7.1.0   | Introduced on the E-Series. |

**Related Commands** [router rip](#) — enters ROUTER mode on the switch.

# distance

Assign a weight (for prioritization) to all routes in the RIP routing table or to a specific route. Lower weights ("administrative distance") are preferred.

## S4820T

### Syntax

```
distance weight [ip-address mask [prefix-name]]
```

To return to the default values, use the `no distance weight [ip-address mask]` command.

### Parameters

|                    |                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>weight</b>      | Enter a number from 1 to 255 for the weight (for prioritization). The default is <b>120</b> .                                   |
| <b>ip-address</b>  | (OPTIONAL) Enter the IP address, in dotted decimal format (A.B.C.D), of the host or network to receive the new distance metric. |
| <b>mask</b>        | If you enter an IP address, also enter a mask for that IP address, in either dotted decimal format or /prefix format (/x).      |
| <b>prefix-name</b> | (OPTIONAL) Enter a configured prefix list name.                                                                                 |

### Defaults

weight = **120**

### Command Modes

ROUTER RIP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T    |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

### Related Commands

[default-metric](#) — assigns one distance metric to all routes learned using the `redistribute` command.

# distribute-list in

Configure a filter for incoming routing updates.

## S4820T

### Syntax

```
distribute-list prefix-list-name in [interface]
```

To delete the filter, use the `no distribute-list prefix-list-name in` command.

### Parameters

***prefix-list-name***

Enter the name of a configured prefix list.

***interface***

(OPTIONAL) Identifies the interface type slot/port as one of the following:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

### Defaults

Not configured.

### Command Modes

ROUTER RIP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.2(1.0) | Introduced on the Z9500.                             |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.29.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.8.1.0  | Introduced on the S-Series.                          |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Related  
Commands**

[ip prefix-list](#) — enters PREFIX-LIST mode and configures a prefix list.

## distribute-list out

Configure a filter for outgoing routing updates.

### S4820T

**Syntax**

```
distribute-list prefix-list-name out [interface | bgp |
connected | isis |ospf | static]
```

To delete the filter, use the `no distribute-list prefix-list-name out` command.

**Parameters**

***prefix-list-name***

Enter the name of a configured prefix list.

***interface***

(OPTIONAL) Identifies the interface type slot/port as one of the following:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

***connected***

(OPTIONAL) Enter the keyword `connected` to filter only directly connected routes.

***isis***

(OPTIONAL) Enter the keyword `isis` to filter only IS-IS routes.

***ospf***

(OPTIONAL) Enter the keyword `ospf` to filter all OSPF routes.

***static***

(OPTIONAL) Enter the keyword `static` to filter manually configured routes.

**Defaults**

Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                          |
|--------------|------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                          |
| 9.2(1.0)     | Introduced on the Z9500.                             |
| 9.0.2.0      | Introduced on the S6000.                             |
| 8.3.19.0     | Introduced on the S4820T.                            |
| 8.3.11.1     | Introduced on the Z9000.                             |
| 8.5.1.0      | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0      | Introduced on the S4810.                             |
| 7.8.1.0      | Introduced on the S-Series.                          |
| 7.6.1.0      | Introduced on the C-Series.                          |
| pre- 6.2.1.1 | Introduced on the E-Series.                          |

**Related Commands** [ip prefix-list](#) — enters PREFIX-LIST mode and configures a prefix list.

## ip poison-reverse

Set the prefix of the RIP routing updates to the RIP infinity value.

### S4820T

**Syntax** `ip poison-reverse`  
To disable poison reverse, use the `no ip poison-reverse` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Related Commands**      [ip split-horizon](#) — sets the RIP routing updates to exclude routing prefixes.

## ip rip receive version

To receive specific versions of RIP, set the interface. The RIP version you set on the interface overrides the version command in ROUTER RIP mode.

### S4820T

**Syntax**                    `ip rip receive version [1] [2]`  
 To return to the default, use the `no ip rip receive version` command.

**Parameters**

|   |                                                  |
|---|--------------------------------------------------|
| 1 | (OPTIONAL) Enter the number 1 for RIP version 1. |
| 2 | (OPTIONAL) Enter the number 2 for RIP version 2. |

**Defaults**                    **RIPv1 and RIPv2**

**Command Modes**            INTERFACE

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

If you want the interface to receive both versions of RIP, use the `ip rip receive version 1 2` command.

#### Related Commands

[ip rip send version](#) — sets the RIP version for sending RIP traffic on an interface.  
[version](#) — sets the RIP version the switch software uses.

## ip rip send version

To send a specific version of RIP, set the interface. The version you set on the interface overrides the version command in ROUTER RIP mode.

### S4820T

#### Syntax

```
ip rip send version [1] [2]
```

To return to the default value, use the `no ip rip send version` command.

#### Parameters

- |   |                                                                                |
|---|--------------------------------------------------------------------------------|
| 1 | (OPTIONAL) Enter the number 1 for RIP version 1. The default is RIP version 1. |
| 2 | (OPTIONAL) Enter the number 2 for RIP version 2.                               |

#### Defaults

RIPv1

#### Command Modes

INTERFACE

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version      | Description                 |
|--------------|-----------------------------|
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information** To enable the interface to send both version of RIP packets, use the `ip rip send version 1 2` command.

**Related Commands** [ip rip receive version](#) — sets the RIP version for the interface to receive traffic.  
[version](#) — sets the RIP version for the switch software.

## ip split-horizon

Enable split-horizon for RIP data on the interface. As described in RFC 2453, the split-horizon scheme prevents any routes learned over a specific interface to be sent back out that interface.

### S4820T

**Syntax** `ip split-horizon`  
To disable split-horizon, use the `no ip split-horizon` command.

**Defaults** Enabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Related Commands** [ip poison-reverse](#) — sets the prefix for RIP routing updates.

## maximum-paths

Set RIP to forward packets over multiple paths.

### S4820T

**Syntax** `maximum-paths number`  
To return to the default values, use the `no maximum-paths` commands.

**Parameters** *number* Enter the number of paths. The range is from 1 to 16. The default is **4** paths.

**Defaults** **4**

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the S-Series. |

| Version      | Description                 |
|--------------|-----------------------------|
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

RIP supports a maximum of 16 ECMP paths.

## neighbor

Define a neighbor router with which to exchange RIP information.

### S4820T

#### Syntax

```
neighbor ip-address
```

To delete a neighbor setting, use the `no neighbor ip-address` command.

#### Parameters

***ip-address***

Enter the IP address, in dotted decimal format, of a router with which to exchange information.

#### Defaults

Not configured.

#### Command Modes

ROUTER RIP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

## Usage Information

When a neighbor router is identified, unicast data exchanges occur. Multiple neighbor routers are possible.

To ensure that only specific interfaces are receiving and sending data, use the `passive-interface` command with the `neighbor` command.

## Related Commands

[passive-interface](#) — sets the interface to only listen to RIP broadcasts.

# network

Enable RIP for a specified network. To enable RIP on all networks connected to the switch, use this command.

## S4820T

### Syntax

```
network ip-address
```

To disable RIP for a network, use the `no network ip-address` command.

### Parameters

***ip-address***

Specify an IP network address in dotted decimal format. You cannot specify a subnet.

### Defaults

No RIP network is configured.

### Command Modes

ROUTER RIP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

## Usage Information

You can enable an unlimited number of RIP networks.

RIP operates over interfaces configured with any address the `network` command specifies.

## offset-list

Specify a number to add to the incoming or outgoing route metrics learned using RIP.

### S4820T

#### Syntax

```
offset-list prefix-list-name {in | out} offset [interface]
```

To delete an offset list, use the `no offset-list prefix-list-name {in | out} offset [interface]` command.

#### Parameters

***prefix-list-name***

Enter the name of an established Prefix list to determine which incoming routes are modified.

***offset***

Enter a number from zero (0) to 16 to be applied to the incoming route metric matching the access list specified. If you set an offset value to zero (0), no action is taken.

***interface***

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

#### Defaults

Not configured.

#### Command Modes

ROUTER RIP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                          |
|--------------|------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                          |
| 9.2(1.0)     | Introduced on the Z9500.                             |
| 9.0.2.0      | Introduced on the S6000.                             |
| 8.3.19.0     | Introduced on the S4820T.                            |
| 8.3.11.1     | Introduced on the Z9000.                             |
| 8.5.1.0      | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0      | Introduced on the S4810.                             |
| 7.8.1.0      | Introduced on the S-Series.                          |
| 7.6.1.0      | Introduced on the C-Series.                          |
| pre- 6.2.1.1 | Introduced on the E-Series.                          |

**Usage Information**

When the offset metric is applied to an interface, that value takes precedence over an offset value that is not extended to an interface.

**Related Commands**

[ip prefix-list](#) — enters PREFIX-LIST mode and configure a prefix list.

## output-delay

Set the interpacket delay of successive packets to the same neighbor.

### S4820T

**Syntax**

`output-delay delay`

To return to the switch software defaults for interpacket delay, use the `no output-delay` command.

**Parameters**

**delay** Specify a number of milliseconds as the delay interval. The range is from 8 to 50.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

This command is intended for low-speed interfaces.

## passive-interface

Suppress routing updates on a specified interface.

### S4820T

**Syntax**

`passive-interface interface`

To delete a passive interface, use the `no passive-interface interface` command.

**Parameters**

***interface***

Enter the following information:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a VLAN, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                                          |
|--------------|------------------------------------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON.                          |
| 9.2(1.0)     | Introduced on the Z9500.                             |
| 9.0.2.0      | Introduced on the S6000.                             |
| 8.3.19.0     | Introduced on the S4820T.                            |
| 8.3.11.1     | Introduced on the Z9000.                             |
| 8.5.1.0      | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0      | Introduced on the S4810.                             |
| 7.8.1.0      | Introduced on the S-Series.                          |
| 7.6.1.0      | Introduced on the C-Series.                          |
| pre- 6.2.1.1 | Introduced on the E-Series.                          |

**Usage Information**

Although the passive interface does not send or receive routing updates, the network on that interface still includes in RIP updates sent using other interfaces.

**Related Commands**

[neighbor](#) — enables RIP for a specified network.

[network](#) — defines a neighbor.

## redistribute

Redistribute information from other routing instances.

### S4820T

**Syntax**

```
redistribute {connected | static}
```

To disable redistribution, use the `no redistribute {connected | static}` command.

**Parameters**

|                  |                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>connected</b> | Enter the keyword <code>connected</code> to specify that information from active routes on interfaces is redistributed. |
| <b>static</b>    | Enter the keyword <code>static</code> to specify that information from static routes is redistributed.                  |

**Defaults**

Not configured.

**Command Modes**

ROUTER RIP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

## Usage Information

To redistribute the default route (0.0.0.0/0), configure the `default-information originate` command.

## Related Commands

[default-information originate](#) — generates a default route for RIP traffic.

# redistribute isis

Redistribute routing information from an IS-IS instance.

## S4820T

### Syntax

```
redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value] [route-map map-name]
```

To disable redistribution, use the `no redistribute isis [tag] [level-1 | level-1-2 | level-2] [metric metric-value] [route-map map-name]` command.

### Parameters

|                  |                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------|
| <b>tag</b>       | (OPTIONAL) Enter the name of the IS-IS routing process.                                                     |
| <b>level-1</b>   | (OPTIONAL) Enter the keywords <code>level-1</code> to redistribute only IS-IS Level-1 routes.               |
| <b>level-1-2</b> | (OPTIONAL) Enter the keywords <code>level-1-2</code> to redistribute both IS-IS Level-1 and Level-2 routes. |
| <b>level-2</b>   | (OPTIONAL) Enter the keywords <code>level-2</code> to redistribute only IS-IS Level-2 routes.               |

|                        |                                                                                                                                                  |                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
|                        | <b>metric <i>metric-value</i></b>                                                                                                                | (OPTIONAL) Enter the keyword <code>metric</code> then a number as the metric value. The range is from 0 to 16. |
|                        | <b>route-map <i>map-name</i></b>                                                                                                                 | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of a configured route map.                  |
| <b>Defaults</b>        | Not configured.                                                                                                                                  |                                                                                                                |
| <b>Command Modes</b>   | ROUTER RIP                                                                                                                                       |                                                                                                                |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>FTOS Command Line Reference Guide</i> . |                                                                                                                |

The following is a list of the FTOS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| pre- 6.2.1.1 | Introduced on the E-Series. |

## redistribute ospf

Redistribute routing information from an OSPF process.

### S4820T

|               |                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>redistribute ospf <i>process-id</i> [match external {1   2}   match internal   metric <i>metric-value</i>] [route-map <i>map-name</i>]</code><br>To disable redistribution, use the <code>no redistribute ospf <i>process-id</i> [match external {1   2}   match internal   metric <i>metric-value</i>] [route-map <i>map-name</i>]</code> command. |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                               |                                                                                                                                                                     |
|-------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>process-id</i></b>      | Enter a number that corresponds to the OSPF process ID to redistribute. The range is from 1 to 65355.                                                               |
|                   | <b>match external {1   2}</b> | (OPTIONAL) Enter the keywords <code>match external</code> then the numbers 1 or 2 to indicated that external 1 routes or external 2 routes should be redistributed. |
|                   | <b>match internal</b>         | (OPTIONAL) Enter the keywords <code>match internal</code> to indicate that internal routes should be redistributed.                                                 |

|                                   |                                                                                                                |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------|
| <b>metric <i>metric-value</i></b> | (OPTIONAL) Enter the keyword <code>metric</code> then a number as the metric value. The range is from 0 to 16. |
| <b>route-map <i>map-name</i></b>  | (OPTIONAL) Enter the keywords <code>route-map</code> then the name of a configured route map.                  |

**Defaults** Not configured.

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

## router rip

To configure and enable RIP, enter ROUTER RIP mode.

### S4820T

**Syntax** `router rip`  
To disable RIP, use the `no router rip` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version      | Description                 |
|--------------|-----------------------------|
| 9.7(0.0)     | Introduced on the S6000-ON. |
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

To enable RIP, assign a network address using the `network` command.

#### Example

```
Dell(conf)#router rip
Dell(conf-router_rip)#
```

#### Related Commands

[network](#) — enables RIP.

[exit](#) — returns to CONFIGURATION mode.

## show config

Display the changes you made to the RIP configuration. The default values are not shown.

### S4820T

**Syntax** `show config`

**Command Modes** ROUTER RIP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

#### Example

```
Dell(conf-router_rip)#show config
!
router rip
 network 172.31.0.0
 passive-interface TenGigabitEthernet 1/1
Dell(conf-router_rip)#
```

## show ip rip database

Display the routes that RIP learns. If the switch learned no RIP routes, no output is generated.

### S4820T

#### Syntax

```
show ip rip database [ip-address mask]
```

#### Parameters

|                          |                                                                                                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b> | (OPTIONAL) Specify an IP address in dotted decimal format to view RIP information on that network only. If you enter an IP address, also enter a mask for that IP address. |
| <b><i>mask</i></b>       | (OPTIONAL) Specify a mask, in /network format, for the IP address.                                                                                                         |

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

#### Usage Information

The following describes the `show ip rip database` command shown in the following example.

| Field                                         | Description                                                   |
|-----------------------------------------------|---------------------------------------------------------------|
| <b>Total number of routes in RIP database</b> | Displays the number of RIP routes stored in the RIP database. |
| <b>100.10.10.0/24 directly connected</b>      | Lists the routes directly connected.                          |
| <b>150.100.0.0 redistributed</b>              | Lists the routes learned through redistribution.              |
| <b>209.9.16.0/24...</b>                       | Lists the routes and the sources advertising those routes.    |

#### Example

```
Dell#show ip rip database
Total number of routes in RIP database: 1624
204.250.54.0/24
    [50/1] via 192.14.1.3, 00:00:12, TenGigabitEthernet 1/15
204.250.54.0/24    auto-summary
203.250.49.0/24
    [50/1] via 192.13.1.3, 00:00:12, TenGigabitEthernet 1/14
203.250.49.0/24    auto-summary
210.250.40.0/24
    [50/2] via 1.1.18.2, 00:00:14, Vlan 18
    [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
210.250.40.0/24    auto-summary
207.250.53.0/24
    [50/2] via 1.1.120.2, 00:00:55, Port-channel 20
    [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
    [50/2] via 1.1.10.2, 00:00:18, Vlan 10
207.250.53.0/24    auto-summary
208.250.42.0/24
    [50/2] via 1.1.120.2, 00:00:55, Port-channel 20
    [50/2] via 1.1.130.2, 00:00:12, Port-channel 30
    [50/2] via 1.1.10.2, 00:00:18, Vlan 10
208.250.42.0/24    auto-summary
```

# show running-config rip

Display the current RIP configuration.

## S4820T

**Syntax** `show running-config rip`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.8.1.0  | Introduced on the S-Series. |
| 7.7.1.0  | Introduced on the C-Series. |
| 7.6.1.0  | Introduced on the E-Series. |

**Example**

```
show running-config rip
!
router rip
  distribute-list Test1 in
  distribute-list Test21 out
  network 10.0.0.0
  passive-interface GigabitEthernet 2/1
  neighbor 20.20.20.20
  redistribute ospf 999
  version 2
```

# timers basic

Manipulate the RIP timers for routing updates, invalid, holddown times, and flush time.

## S4820T

### Syntax

```
timers basic update invalid holddown flush
```

To return to the default settings, use the `no timers basic` command.

### Parameters

|                 |                                                                                                                                                                                                                                                                                                                               |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>update</i>   | Enter the number of seconds to specify the rate at which RIP routing updates are sent. The range is from zero (0) to 4294967295. The default is <b>30 seconds</b> .                                                                                                                                                           |
| <i>invalid</i>  | Enter the number of seconds to specify the time interval before routing updates are declared invalid or expired. The invalid value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is <b>180 seconds</b> .                                                       |
| <i>holddown</i> | Enter the number of seconds to specify a time interval during which the route is marked as unreachable but still sending RIP packets. The holddown value should be at least three times the update timer value. The range is from zero (0) to 4294967295. The default is <b>180 seconds</b> .                                 |
| <i>flush</i>    | Enter the number of seconds to specify the time interval during which the route is advertised as unreachable. When this interval expires, the route is flushed from the routing table. The flush value should be greater than the update value. The range is from zero (0) to 4294967295. The default is <b>240 seconds</b> . |

### Defaults

- update = **30 seconds**
- invalid = **180 seconds**
- holddown = **180 seconds**
- flush = **240 seconds**

### Command Modes

ROUTER RIP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version      | Description                 |
|--------------|-----------------------------|
| 9.0.2.0      | Introduced on the S6000.    |
| 8.3.19.0     | Introduced on the S4820T.   |
| 8.3.11.1     | Introduced on the Z9000.    |
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

If you change the timers on one router, also synchronize the timers on all routers in the RIP domain.

## version

Specify either RIP version 1 or RIP version 2.

### S4820T

**Syntax**

`version {1 | 2}`

To return to the default version setting, use the `no version` command.

**Parameters**

- 1 Enter the keyword 1 to specify RIP version 1.
- 2 Enter the keyword 2 to specify RIP version 2.

**Defaults**

The Dell Networking OS sends RIPv1 and receives RIPv1 and RIPv2.

**Command Modes**

ROUTER RIP

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version      | Description                 |
|--------------|-----------------------------|
| 8.3.7.0      | Introduced on the S4810.    |
| 7.8.1.0      | Introduced on the S-Series. |
| 7.6.1.0      | Introduced on the C-Series. |
| pre- 6.2.1.1 | Introduced on the E-Series. |

**Related  
Commands**

[ip rip receive version](#) — sets the RIP version the interface receives.

[ip rip send version](#) — sets the RIP version the interface sends.

## Remote Monitoring (RMON)

The Dell Networking operating software remote monitoring (RMON) is implemented on the S4820T platform.

Dell Networking OS RMON is based on IEEE standards, providing both 32-bit and 64-bit monitoring and long-term statistics collection. Dell Networking OS RMON supports the following RMON groups, as defined in RFC-2819, RFC-3273, RFC-3434, and RFC-4502:

- Ethernet Statistics Table; RFC-2819
- Ethernet Statistics High-Capacity Table; RFC-3273, 64bits
- Ethernet History Control Table; RFC-2819
- Ethernet History Table; RFC-2819
- Ethernet History High-Capacity Table; RFC-3273, 64bits
- Alarm Table; RFC-2819
- High-Capacity Alarm Table (64bits); RFC-3434, 64bits
- Event Table; RFC-2819
- Log Table; RFC-2819
- User History; RFC-4502
- Probe Configuration (Capabilities, SoftwareRev, HardwareRev, DateTime and ResetControl); RFC-4502

Dell Networking OS RMON does not support the following statistics:

- etherStatsCollisions
- etherHistoryCollisions
- etherHistoryUtilization

 **NOTE:** Only SNMP GET/GETNEXT access is supported. Configure RMON using the RMON commands. Collected data is lost during a chassis reboot.

### rmon alarm

Set an alarm on any MIB object.

#### S4820T

**Syntax** `rmon alarm number variable interval {delta | absolute} rising-threshold value event-number falling-threshold value event-number [owner string]`

To disable the alarm, use the `no rmon alarm number` command.

## Parameters

|                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>number</i></b>                               | Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.                                                                                                                                                                                                                                                                                                                   |
| <b><i>variable</i></b>                             | Enter the MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3. The object type must be a 32-bit integer.                                                                                                                                                                                                                                                               |
| <b><i>interval</i></b>                             | Time, in seconds, the alarm monitors the MIB variables; this is the <code>alarmSampleType</code> in the RMON alarm table. The range is from 5 to 3600 seconds.                                                                                                                                                                                                                                                      |
| <b><i>delta</i></b>                                | Enter the keyword <code>delta</code> to test the change between MIB variables. This is the <code>alarmSampleType</code> in the RMON alarm table.                                                                                                                                                                                                                                                                    |
| <b><i>absolute</i></b>                             | Enter the keyword <code>absolute</code> to test each MIB variable directly. This is the <code>alarmSampleType</code> in the RMON alarm table.                                                                                                                                                                                                                                                                       |
| <b><i>rising-threshold value event-number</i></b>  | Enter the keywords <code>rising-threshold</code> then the value (32 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the <code>alarmRisingEventIndex</code> or <code>alarmTable</code> of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.          |
| <b><i>falling-threshold value event-number</i></b> | Enter the keywords <code>falling-threshold</code> then the value (32 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the <code>alarmFallingEventIndex</code> or the <code>alarmTable</code> of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero. |
| <b><i>owner string</i></b>                         | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to specify an owner for the alarm. This is the <code>alarmOwner</code> object in the <code>alarmTable</code> of the RMON MIB.                                                                                                                                                                                                                   |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## rmon collection history

Enable the RMON MIB history group of statistics collection on an interface.

### S4820T

#### Syntax

```
rmon collection history {controlEntry integer} [owner name]
[buckets number] [interval seconds]
```

To remove a specified RMON history group of statistics collection, use the `no rmon collection history {controlEntry integer}` command.

#### Parameters

|                                        |                                                                                                                                                                                                                                                                  |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>controlEntry<br/><i>integer</i></b> | Enter the keyword <code>controlEntry</code> to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON group of statistics. The integer value must be a unique index in the RMON history table. |
| <b>owner name</b>                      | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to record the owner of the RMON group of statistics.                                                                                                                                         |
| <b>buckets<br/>number</b>              | (OPTIONAL) Enter the keyword <code>buckets</code> then the number of buckets for the RMON collection history group of statistics. The bucket range is from 1 to 1000. The default is <b>50</b> .                                                                 |
| <b>interval<br/>seconds</b>            | (OPTIONAL) Enter the keyword <code>interval</code> then the number of seconds in each polling cycle. The range is from 5 to 3600 seconds. The default is <b>1800 seconds</b> .                                                                                   |

| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## rmon collection statistics

Enable RMON MIB statistics collection on an interface.

### S4820T

#### Syntax

```
rmon collection statistics {controlEntry integer} [owner name]
```

To remove RMON MIB statistics collection on an interface, use the `no rmon collection statistics {controlEntry integer}` command.

#### Parameters

|                                        |                                                                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>controlEntry<br/><i>integer</i></b> | Enter the keyword <code>controlEntry</code> to specify the RMON group of statistics using a value. Then enter an integer value from 1 to 65535 that identifies the RMON Statistic Table. The integer value must be a unique in the RMON statistic table. |
| <b>owner <i>name</i></b>               | (OPTIONAL) Enter the keyword <code>owner</code> then the owner name to record the owner of the RMON group of statistics.                                                                                                                                 |

#### Defaults

none

CONFIGURATION INTERFACE (config-if)

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## rmon event

Add an event in the RMON event table.

### S4820T

**Syntax** `rmon event number [log] [trap community] [description string]`  
 To disable RMON on an interface, use the `no rmon event number` command.

| Parameters                       |  |                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>number</i></b>             |  | Assign an event number in integer format. The range is from 1 to 65535. You must ensure that the value you enter is unique in the RMON event table.                                                                                                                                                                                                          |
| <b>log</b>                       |  | (OPTIONAL) Enter the keyword <code>log</code> to generate an RMON event log. This option sets the <code>eventType</code> to either <code>log</code> or <code>log-and-snmptrap</code> in the RMON event table. The default is <code>None</code> .                                                                                                             |
| <b>trap <i>community</i></b>     |  | (OPTIONAL) Enter the keyword <code>trap</code> followed by the SNMP community string to generate SNMP traps for an RMON event entry. This option sets the <code>eventType</code> to either <code>snmptrap</code> or <code>log-and-snmptrap</code> in the RMON event table. In addition to the SNMP traps, this option also generates a <code>syslog</code> . |
| <b>description <i>string</i></b> |  | (OPTIONAL) Enter the keyword <code>description</code> then a string describing the event.                                                                                                                                                                                                                                                                    |
| <b>owner <i>name</i></b>         |  | (OPTIONAL) Enter the keyword <code>owner</code> then the name of the owner of this event.                                                                                                                                                                                                                                                                    |

**Defaults** As noted in the *Parameters* section.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## rmon hc-alarm

Set an alarm on any MIB object.

### S4820T

**Syntax**

```
rmon hc-alarm number variable interval {delta | absolute}  
rising-threshold value event-number falling-threshold value  
event-number [owner string]
```

To disable the alarm, use the `no rmon hc-alarm number` command.

**Parameters**

|                        |                                                                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>number</i></b>   | Enter the alarm integer number from 1 to 65535. The value must be unique in the RMON alarm table.                                                 |
| <b><i>variable</i></b> | The MIB object to monitor. The variable must be in the SNMP OID format; for example, 1.3.6.1.2.1.1.3 The object type must be a 64-bit integer.    |
| <b><i>interval</i></b> | Time, in seconds, the alarm monitors the MIB variables; this is the alarmSampleType in the RMON alarm table. The range is from 5 to 3600 seconds. |
| <b><i>delta</i></b>    | Enter the keyword <code>delta</code> to test the change between MIB variables. This is the alarmSampleType in the RMON alarm table.               |

**absolute** Enter the keyword `absolute` to test each MIB variable directly. This is the `alarmSampleType` in the RMON alarm table.

**rising-threshold value event-number** Enter the keywords `rising-threshold` then the value (64 bit) the rising-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the rising threshold exceeds its limit. This value is the same as the `alarmRisingEventIndex` or `alarmTable` of the RMON MIB. If there is no corresponding rising-threshold event, the value is zero.

**falling-threshold value event-number** Enter the keywords `falling-threshold` then the value (64 bit) the falling-threshold alarm is either triggered or reset. Then enter the event-number to trigger when the falling threshold exceeds its limit. This value is the same as the `alarmFallingEventIndex` or the `alarmTable` of the RMON MIB. If there is no corresponding falling-threshold event, the value is zero.

**owner string** (OPTIONAL) Enter the keyword `owner` then the owner name to specify an owner for the alarm. This is the `alarmOwner` object in the `alarmTable` of the RMON MIB.

**Defaults**

**owner**

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

# show rmon

Display the RMON running status including the memory usage.

## S4820T

**Syntax**                    show rmon

**Defaults**                none

**Command Modes**        EXEC

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

### Example

```
Dell# show rmon
RMON status
  total memory used 218840 bytes.
  ether statistics table: 8 entries, 4608 bytes
  ether history table: 8 entries, 6000 bytes
  alarm table: 390 entries, 102960 bytes
  high-capacity alarm table: 5 entries, 1680 bytes
  event table: 500 entries, 206000 bytes
  log table: 2 entries, 552 bytes
Dell#
```

# show rmon alarms

Display the contents of the RMON alarm table.

## S4820T

|                        |                                                                                                                                                                |                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | show rmon alarms [ <i>index</i> ] [ <i>brief</i> ]                                                                                                             |                                                                                                            |
| <b>Parameters</b>      | <b><i>index</i></b>                                                                                                                                            | (OPTIONAL) Enter the table index number to display just that entry.                                        |
|                        | <b><i>brief</i></b>                                                                                                                                            | (OPTIONAL) Enter the keyword <code>brief</code> to display the RMON alarm table in an easy-to-read format. |
| <b>Defaults</b>        | none                                                                                                                                                           |                                                                                                            |
| <b>Command Modes</b>   | EXEC                                                                                                                                                           |                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                            |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Example (Index)**

```
Dell#show rmon alarm 1
RMON alarm entry 1
  sample Interval: 5
  object: 1.3.6.1.2.1.1.3
  sample type: absolute value.
  value: 255161
  alarm type: rising or falling alarm.
  rising threshold: 1, RMON event index: 1
  falling threshold: 501, RMON event index: 501
  alarm owner: 1
  alarm status: OK
Dell#
```

**Example (Brief)**

```
Dell#show rmon alarm br
index    SNMP OID
```

```

-----
1      1.3.6.1.2.1.1.3
2      1.3.6.1.2.1.1.3
3      1.3.6.1.2.1.1.3
4      1.3.6.1.2.1.1.3
5      1.3.6.1.2.1.1.3
6      1.3.6.1.2.1.1.3
7      1.3.6.1.2.1.1.3
8      1.3.6.1.2.1.1.3
9      1.3.6.1.2.1.1.3
10     1.3.6.1.2.1.1.3
11     1.3.6.1.2.1.1.3
12     1.3.6.1.2.1.1.3
13     1.3.6.1.2.1.1.3

21     1.3.6.1.2.1.1.3
22     1.3.6.1.2.1.1.3
Dell#

```

## show rmon events

Display the contents of the RMON event table.

### S4820T

**Syntax** `show rmon events [index] [brief]`

**Parameters**

|                     |                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------|
| <b><i>index</i></b> | (OPTIONAL) Enter the table index number to display just that entry.                                        |
| <b><i>brief</i></b> | (OPTIONAL) Enter the keyword <code>brief</code> to display the RMON event table in an easy-to-read format. |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Example  
(Index)**

```

Dell(conf)#rmon event 111                -> Default case
Dell(conf)#rmon event 112 log            -> Only "log" option
Dell(conf)#rmon event 113 trap private   -> Only "trap" option
Dell(conf)#rmon event 114 log trap public-> Both "log" and
"trap" options
Dell(conf)#do show rmon events

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                          |

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                 |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.1.1.0 | Introduced on the E-Series. |

**Example  
(Index)**

```
Dell#show rmon hc-alarm 1
RMON high-capacity alarm entry 2
  object: 1.3.6.1.2.1.2.2.1.4.2099844
  sample interval: 10
  sample type: delta value.
  value: 0, value status: positive
  alarm type: rising or falling alarm.
  alarm rising threshold value: positive.
  rising threshold: 500, RMON event index: 3
  alarm falling threshold value: positive.
  falling threshold: 300, RMON event index: 4
  alarm sampling failed 0 times.
  alarm owner:
  alarm storage type: non-volatile.
  alarm status: OK
Dell#
```

**Example (Brief)**

```
Dell#show rmon hc-alarm brief
index      SNMP OID
-----
1          1.3.6.1.2.1.1.3
2          1.3.6.1.2.1.1.3
3          1.3.6.1.2.1.1.3
4          1.3.6.1.2.1.1.3
5          1.3.6.1.2.1.1.3
Dell#
```

## show rmon history

Display the contents of the RMON Ethernet history table.

| <b>Command Modes</b> | EXEC                                                |                                                                                                                |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Example (Index)

```
Dell#show rmon history 6001
RMON history control entry 6001
interface: ifIndex.100974631 TenGigabitEthernet 2/1
bucket requested: 1
bucket granted: 1
sampling interval: 5 sec
owner: 1
status: OK
Dell#
```

## Example (Brief)

```
Dell#show rmon history brief
index ifIndex interface
-----
-----
6001 100974631 TenGigabitEthernet 2/2
6002 100974631 TenGigabitEthernet 2/2
6003 101236775 TenGigabitEthernet 2/1
6004 101236775 TenGigabitEthernet 2/1
9001 134529054 TenGigabitEthernet 3/2
9002 134529054 TenGigabitEthernet 3/2
9003 134791198 TenGigabitEthernet 3/1
9004 134791198 TenGigabitEthernet 3/1
Dell#
```

# show rmon log

Display the contents of the RMON log table.

## S4820T

**Syntax** `show rmon log [index] [brief]`

**Parameters**

|              |                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------|
| <b>index</b> | (OPTIONAL) Enter the table index number to display just that entry.                                      |
| <b>brief</b> | (OPTIONAL) Enter the keyword <code>brief</code> to display the RMON log table in an easy-to-read format. |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage Information** The log table has a maximum of 500 entries. If the log exceeds that maximum, the oldest log entry is purged to allow room for the new entry.

**Example (Index)**

```
Dell#show rmon log 2
RMON log entry, alarm table index 2, log index 1
  log time: 14638 (THU AUG 12 22:10:40 2004)
  description: 2
Dell#
```

**Example (Brief)**

```
Dell#show rmon log br
eventIndex      description
-----
2                2
```

## show rmon statistics

Display the contents of RMON Ethernet statistics table.

# Rapid Spanning Tree Protocol (RSTP)

The Dell Networking operating software implementation of rapid spanning tree protocol (RSTP) is based on the IEEE 802.1w standard spanning-tree protocol. The RSTP algorithm configures connectivity throughout a bridged local area network (LAN) that is comprised of LANs interconnected by bridges.

Dell Networking OS supports RSTP.

## bridge-priority

Set the bridge priority for RSTP.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>bridge-priority <i>priority-value</i></code><br>To return to the default value, use the <code>no bridge-priority</code> command.                         |
| <b>Parameters</b>      | <b><i>priority-value</i></b> Enter a number as the bridge priority value in increments of 4096. The range is from 0 to 61440. The default is <b>32768</b> .    |
| <b>Defaults</b>        | <b>32768</b>                                                                                                                                                   |
| <b>Command Modes</b>   | CONFIGURATION RSTP (conf-rstp)                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

**Related Commands** [protocol spanning-tree rstp](#) — enters rapid spanning tree mode.

## debug spanning-tree rstp

Enable debugging of RSTP and view information on the protocol.

**Syntax** `debug spanning-tree rstp [all | bpdu interface {in | out} | events]`

To disable debugging, use the `no debug spanning-tree rstp` command.

### Parameters

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                       | (OPTIONAL) Enter the keyword <code>all</code> to debug all spanning tree operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>bpdu interface {in   out}</b> | <p>(OPTIONAL) Enter the keyword <code>bpdu</code> to debug the bridge protocol data units.</p> <p>(OPTIONAL) Enter the keyword <code>interface</code> along with the type slot/port of the interface you want displayed. Type slot/port options are the following:</p> <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> </ul> <p>Optionally, enter an <code>in</code> or <code>out</code> parameter with the optional interface:</p> <ul style="list-style-type: none"> <li>For Receive, enter <code>in</code>.</li> <li>For Transmit, enter <code>out</code>.</li> </ul> |
| <b>events</b>                    | (OPTIONAL) Enter the keyword <code>events</code> to debug RSTP events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.2.1.1  | Introduced on the E-Series.                          |

### Example

```
Dell#debug spanning-tree rstp bpdu tengigabitethernet 2/1 ?
in Receive (in)
out Transmit (out)
```

## description

Enter a description of the rapid spanning tree.

### Syntax

```
description {description}
```

To remove the description, use the `no description {description}` command.

### Parameters

**description** Enter a description to identify the rapid spanning tree (80 characters maximum).

### Defaults

none

### Command Modes

SPANNING TREE (The prompt is "config-rstp".)

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Version     | Description               |
|-------------|---------------------------|
| 8.3.19.0    | Introduced on the S4820T. |
| 8.3.11.1    | Introduced on the Z9000.  |
| 8.3.7.0     | Introduced on the S4810.  |
| pre-7.7.1.0 | Introduced.               |

**Related Commands** [protocol spanning-tree rstp](#) — enters SPANNING TREE mode on the switch.

## disable

Disable RSTP globally on the system.

**Syntax** `disable`  
To enable Rapid Spanning Tree Protocol, use the `no disable` command.

**Defaults** RSTP is disabled.

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Related Commands** [protocol spanning-tree rstp](#) — enters SPANNING TREE mode on the switch.

# forward-delay

Configure the amount of time the interface waits in the Listening State and the Learning State before transitioning to the Forwarding State.

|                        |                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>forward-delay seconds</code><br>To return to the default setting, use the <code>no forward-delay</code> command.                                                                    |
| <b>Parameters</b>      | <b>seconds</b> Enter the number of seconds that Dell Networking OS waits before transitioning RSTP to the forwarding state. The range is from 4 to 30. The default is <b>15 seconds</b> . |
| <b>Defaults</b>        | <b>15 seconds</b>                                                                                                                                                                         |

|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Related Commands</b> | <a href="#">hello-time</a> — changes the time interval between BPDUs.<br><a href="#">max-age</a> — changes the wait time before RSTP refreshes the protocol configuration information. |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# hello-time

Set the time interval between the generation of the RSTP bridge protocol data units (BPDUs).

**Syntax** `hello-time [milli-second] seconds`  
To return to the default value, use the `no hello-time` command.

**Parameters**

|                     |                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b>      | Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10 seconds. The default is <b>2 seconds</b> .       |
| <b>milli-second</b> | Enter the keywords <code>milli-second</code> to configure a hello time on the order of milliseconds. The range is from 50 to 950 milliseconds |

**Defaults** **2 seconds**

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                 |
|----------|-------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                 |
| 9.0.2.0  | Introduced on the S6000.                                    |
| 8.3.19.0 | Introduced on the S4820T.                                   |
| 8.3.11.1 | Introduced on the Z9000.                                    |
| 8.3.7.0  | Introduced on the S4810.                                    |
| 8.3.1.0  | Added the <code>milli-second</code> option to the S-Series. |
| 7.6.1.0  | Introduced on the S-Series.                                 |
| 7.5.1.0  | Introduced on the C-Series.                                 |
| 6.2.1.1  | Introduced on the E-Series.                                 |

**Usage Information** The hello time is encoded in BPDUs in increments of 1/256ths of a second. The standard minimum hello time in seconds is 1 second, which is encoded as 256. Millisecond hello times are encoded using values less than 256; the millisecond hello time equals  $(x/1000)*256$ .

When you configure millisecond hellos, the default hello interval of 2 seconds is still used for edge ports; the millisecond hello interval is not used.

**Related  
Commands**

[forward-delay](#) — changes the wait time before RSTP transitions to the Forwarding state.

[max-age](#) — changes the wait time before RSTP refreshes the protocol configuration information.

## max-age

To maintain configuration information before refreshing that information, set the time interval for the RSTP bridge.

**Syntax**

`max-age seconds`

To return to the default values, use the `no max-age` command.

**Parameters**

***max-age***

Enter a number of seconds the Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40 seconds. The default is **20 seconds**.

**Defaults**

**20 seconds**

**Command  
Modes**

CONFIGURATION RSTP (conf-rstp)

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Related  
Commands**

[forward-delay](#) — changes the wait time before RSTP transitions to the Forwarding state.

[hello-time](#) — changes the time interval between BPDUs.

## protocol spanning-tree rstp

To configure RSTP, enter RSTP mode.

**Syntax** `protocol spanning-tree rstp`  
To exit RSTP mode, use the `exit` command.

**Defaults** Not configured

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** RSTP is not enabled when you enter RSTP mode. To enable RSTP globally on the system, use the `no disable` command from RSTP mode.

**Example**  
`Dell(conf)#protocol spanning-tree rstp`  
`Dell(config-rstp)##no disable`

**Related Commands** [disable](#) — disables RSTP globally on the system.

## show config

View the current configuration for the mode. Only non-default values are displayed.

**Syntax** `show config`

**Command Modes** CONFIGURATION RSTP (conf-rstp)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Example**

```
Dell(conf-rstp)#show config
!
protocol spanning-tree rstp
  no disable
  bridge-priority 16384
```

## show spanning-tree rstp

Display the RSTP configuration.

**Syntax** `show spanning-tree rstp [brief] [guard]`

**Parameters**

|              |                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>brief</b> | (OPTIONAL) Enter the keyword <code>brief</code> to view a synopsis of the RSTP configuration information.                             |
| <b>guard</b> | (OPTIONAL) Enter the keyword <code>guard</code> to display the type of guard enabled on an RSTP interface and the current port state. |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

| Version  | Description                                                                                     |
|----------|-------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                     |
| 9.0.2.0  | Introduced on the S6000.                                                                        |
| 8.3.19.0 | Introduced on the S4820T.                                                                       |
| 8.3.11.1 | Introduced on the Z9000.                                                                        |
| 8.4.2.1  | Added support for the optional guard keyword on the C-Series, S-Series, and E-Series TeraScale. |
| 8.3.7.0  | Introduced on the S4810.                                                                        |
| 7.6.1.0  | Introduced on the S-Series.                                                                     |
| 7.5.1.0  | Introduced on the C-Series.                                                                     |
| 6.4.1.0  | Expanded to display the port error disable state (EDS) caused by loopback BPDU inconsistency.   |
| 6.2.1.1  | Introduced on the E-Series.                                                                     |

**Usage Information**

The following describes the `show spanning-tree rstp guard` command shown in the following example.

| Field                 | Description                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface Name</b> | RSTP interface.                                                                                                                         |
| <b>Instance</b>       | RSTP instance.                                                                                                                          |
| <b>Sts</b>            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), disabled (DIS), or shut down (EDS Shut). |
| <b>Guard Type</b>     | Types of STP guard configured (Root, Loop, or BPDU guard)                                                                               |

## spanning-tree rstp

Configure an RSTP interface with one of these settings: port cost, edge port with optional bridge port data unit (BPDU) guard, port priority, loop guard, or root guard.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                  |
|----------|--------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                  |
| 9.0.2.0  | Introduced on the S6000.                                                                                     |
| 8.3.19.0 | Introduced on the S4820T.                                                                                    |
| 8.3.11.1 | Introduced on the Z9000.                                                                                     |
| 8.4.2.1  | Added support for the optional <code>guard</code> keyword on the C-Series, S-Series, and E-Series TeraScale. |
| 8.3.7.0  | Introduced on the S4810.                                                                                     |
| 8.2.1.0  | Introduced the <code>hardware shutdown-on-violation</code> options.                                          |
| 7.6.1.0  | Introduced on the S-Series.                                                                                  |
| 7.5.1.0  | Introduced on the C-Series.                                                                                  |
| 7.4.1.0  | Added the optional bridge port data unit (BPDU) guard.                                                       |
| 6.2.1.1  | Introduced on the E-Series.                                                                                  |

## Usage Information

The `BPDU guard` option prevents the port from participating in an active STP topology in case a BPDU appears on a port unintentionally, or is misconfigured, or is subject to a DOS attack. This option places the port into an Error Disable state if a BPDU appears and a message is logged so that the administrator can take corrective action.

**NOTE:** A port configured as an edge port, on an RSTP switch, immediately transitions to the Forwarding state. Only configure ports connected to end-hosts as edge ports. Consider an edge port similar to a port with a `spanning-tree portfast` enabled.

If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

You cannot enable STP root guard and loop guard at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message displays: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

Enabling Portfast BPDU guard and loop guard at the same time on a port results in a port that remains in a Blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

### Example

```
Dell(conf)#interface tengigabitethernet 4/1
Dell(conf-if-gi-4/0)#spanning-tree rstp edge-port
Dell(conf-if-gi-4/0)#show config
!
interface TenGigabitEthernet 4/1
  no ip address
  switchport
  spanning-tree rstp edge-port
  no shutdown
Dell#
```

## tc-flush-standard

Enable the MAC address flushing after receiving every topology change notification.

### Syntax

`tc-flush-standard`

To disable, use the `no tc-flush-standard` command.

### Defaults

Disabled

### Command

CONFIGURATION (conf-rstp)

### Modes

### Command

### History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.5.1.0  | Introduced on the E-Series. |

**Usage  
Information**

By default, Dell Networking OS implements an optimized flush mechanism for RSTP. This implementation helps in flushing MAC addresses only when necessary (and less often), allowing for faster convergence during topology changes. However, if a standards-based flush mechanism is needed, you can turn on this *knob* command to enable flushing MAC addresses after receiving every topology change notification.

# Software-Defined Networking (SDN)

Dell Networking operating software supports Software-Defined Networking (SDN). For more information, refer to the *SDN Deployment Guide*.

# Security

The commands in this chapter are available on Dell Networking OS.

This chapter contains various types of security commands offered in the Dell Networking operating software. The commands are listed in the following sections:

- [AAA Accounting Commands](#)
- [Authorization and Privilege Commands](#)
- [Authentication and Password Commands](#)
- [RADIUS Commands](#)
- [TACACS+ Commands](#)
- [Port Authentication \(802.1X\) Commands](#)
- [SSH Server and SCP Commands](#)
- [Secure DHCP Commands](#)

For configuration details, refer to the Security chapter in the *Dell Networking OS` Configuration Guide*.

**NOTE:** Dell Networking OS implements LEAP with MSCHAP v2 supplicant.

## AAA Accounting Commands

AAA Accounting enables tracking of services that users are accessing and the amount of network resources being consumed by those services. When you enable AAA Accounting, the network server reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record is comprised of accounting AV pairs and is stored on the access control server.

As with authentication and authorization, you must configure AAA Accounting by defining a named list of accounting methods, and then applying that list to various interfaces.

### aaa accounting

Enable AAA Accounting and create a record for monitoring the accounting function.

#### S4820T

```
Syntax          aaa accounting {system | exec | commands level | role role-
                 name} {name | default}{start-stop | wait-start | stop-only}
                 {tacacs+}
```

To disable AAA Accounting, use the `no aaa accounting {system | exec | command level} {name | default}{start-stop | wait-start | stop-only} {tacacs+} command`.

## Parameters

|                                          |                                                                                                                                                                                                                                                        |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>system</b>                            | Enter the keyword <code>system</code> to send accounting information of any other AAA configuration.                                                                                                                                                   |
| <b>exec</b>                              | Enter the keyword <code>exec</code> to send accounting information when a user has logged in to EXEC mode.                                                                                                                                             |
| <b>commands {level   role role-name}</b> | Enter the keyword <code>command</code> then a privilege level for accounting of commands executed at that privilege level or enter the keyword <code>role</code> then the role name for accounting of commands executed by a user with that user role. |
| <b>name   default</b>                    | Enter one of the following: <ul style="list-style-type: none"> <li>For <code>name</code>, enter a user-defined name of a list of accounting methods.</li> <li>For <code>default</code>, the default accounting methods used.</li> </ul>                |
| <b>start-stop</b>                        | Enter the keywords <code>start-stop</code> to send a “start accounting” notice at the beginning of the requested event and a “stop accounting” notice at the end of the event.                                                                         |
| <b>wait-start</b>                        | Enter the keywords <code>wait-start</code> to ensure that the TACACS + security server acknowledges the start notice before granting the user’s process request.                                                                                       |
| <b>stop-only</b>                         | Enter the keywords <code>stop-only</code> to instruct the TACACS+ security server to send a “stop record accounting” notice at the end of the requested user process.                                                                                  |
| <b>tacacs+</b>                           | Enter the keyword <code>tacacs+</code> to use TACACS+ data for accounting. The Dell Networking OS currently only supports TACACS+ accounting.                                                                                                          |

## Defaults

none

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                         |
|----------|---------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                         |
| 9.5(0.0) | Added support for roles on the Z9000, S6000, S4820T, S4810, and MXL |

| Version  | Description                 |
|----------|-----------------------------|
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.3.1.0  | Introduced on the E-Series. |

#### Usage Information

In the example above, TACACS+ accounting is used to track all usage of EXEC command and commands on privilege level 15.

Privilege level 15 is the default. If you want to track usage at privilege level 1 for example, use the `aaa accounting command 1 command`.

#### Example

```
Dell(conf)# aaa accounting exec default start-stop tacacs+
Dell(conf)# aaa accounting command 15 default start-stop tacacs
+
Dell(conf)# aaa accounting command role secaadmin default
start-stop tacacs+
```

#### Related Commands

[enable password](#) — changes the password for the `enable` command.

[login authentication](#) — enables AAA login authentication on the terminal lines.

[password](#) — creates a password.

[tacacs-server host](#) — specifies a TACACS+ server host.

## aaa accounting suppress

Prevent the generation of accounting records of users with the user name value of NULL.

#### Syntax

```
aaa accounting suppress null-username
```

To permit accounting records to users with user name value of NULL, use the `no aaa accounting suppress null-username` command.

#### Defaults

Accounting records are recorded for all users.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4280T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.3.1.0  | Introduced on the E-Series. |

#### Usage Information

Dell Networking OS issues accounting records for all users on the system, including users whose username string, due to protocol translation, is NULL. For example, a user who comes on line with the `aaa authentication login method-list none` command is applied. To prevent the accounting records from being generated for sessions that do not have user names associated to them, use the `aaa accounting suppress` command.

## accounting

Apply an accounting method list to terminal lines.

### S4820T

**Syntax** `accounting {exec | commands {level | role role-name} method-list`

| Parameters                               |                                                                                                                                                                                                                                                 |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>exec</b>                              | Enter the keyword <code>exec</code> to apply an EXEC level accounting method list.                                                                                                                                                              |
| <b>commands {level   role role-name}</b> | Enter the keywords <code>commands level</code> to apply an EXEC and CONFIGURATION level accounting method list by enter the keyword <code>role</code> and then the role name for accounting of commands executed by a user with that user role. |
| <b>method-list</b>                       | Enter a method list that you defined using the <code>aaa accounting exec</code> or <code>aaa accounting commands</code> .                                                                                                                       |

**Defaults** none

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                      |
|----------|------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.                                      |
| 9.5(0.0) | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                         |

| 7.6.1.0  | Introduced on the S-Series.                                      |
| 7.5.1.0  | Introduced on the C-Series.                                      |
| 6.3.1.0  | Introduced on the E-Series.                                      |

**Related  
Commands**

[aaa accounting](#) — enables AAA Accounting and creates a record for monitoring the accounting function.

## show accounting

Display the active accounting sessions for each online user.

**Syntax** `show accounting`

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 7.5.1.0 | Introduced on the C-Series. |
| 6.3.1.0 | Introduced on the E-Series. |

**Usage Information** This command steps through all active sessions and then displays the accounting records for the active account functions.

**Example**

```
Dell#show accounting
Active accounted actions on tty2, User admin Priv 1 Role
  Task ID 2, EXEC Accounting record, 00:02:03 Elapsed,
service=shell
Active accounted actions on tty3, User ad Priv 15 Role
  Task ID 7, EXEC Accounting record, 00:01:22 Elapsed,
service=shell
Active accounted actions on tty4, User ad Priv 15 Role
  Task ID 11, EXEC Accounting record, 00:00:35 Elapsed,
service=shell
Active accounted actions on tty5, User ad1 Priv 1 Role sysadmin
  Task ID 16, EXEC Accounting record, 00:00:04 Elapsed,
service=shell
Dell#
```

**Related Commands** [aaa accounting](#) — enables AAA Accounting and creates a record for monitoring the accounting function.

## Authorization and Privilege Commands

To set command line authorization and privilege levels, use the following commands.

### authorization

Apply an authorization method list to terminal lines.

#### S4820T

**Syntax**

```
authorization {exec | commands {level | role role-name}}
method-list
```

#### Parameters

|                                          |                                                                                                                                                                                                                                                                           |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>exec</b>                              | Enter the keyword <code>exec</code> to apply an EXEC level authorization method list.                                                                                                                                                                                     |
| <b>commands {level   role role-name}</b> | Enter the keyword <code>commands</code> followed by either a privilege level for accounting of commands executed at that privilege level, or enter the keyword <code>role</code> then the role name for authorization of commands executed by a user with that user role. |

|                         | <b><i>method-list</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Enter a method list that you defined using the <code>aaa accounting exec</code> or <code>aaa accounting</code> commands. |                |                    |                 |                             |                 |                                                                      |                 |                          |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                |                             |

## aaa authorization commands

Set parameters that restrict (or permit) a user’s access to EXEC and CONFIGURATION level commands.

|               |                                                                                                                                                                                                                                              |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>aaa authorization commands {level   role role-name}{name  default} {local   tacacs+  none}  Undo a configuration with the no aaa authorization commands {level   role role-name} {name default} {local   tacacs+   none} command.</pre> |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Parameters

|                       |                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------|
| <b>commands level</b> | Enter the keyword <code>commands</code> then the command privilege level for command level authorization. |
| <b>role role-name</b> | Enter the keyword <code>role</code> then the role name.                                                   |
| <b>name</b>           | Define a name for the list of authorization methods.                                                      |
| <b>default</b>        | Define the default list of authorization methods.                                                         |
| <b>local</b>          | Use the authorization parameters on the system to perform authorization.                                  |
| <b>tacacs+</b>        | Use the TACACS+ protocol to perform authorization.                                                        |
| <b>none</b>           | Enter the keyword <code>none</code> to apply no authorization.                                            |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                     |
|----------|-----------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.                                     |
| 9.5(0.0) | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL |
| 9.2(1.0) | Introduced on the Z9500.                                        |
| 9.0.2.0  | Introduced on the S6000.                                        |
| 8.3.19.0 | Introduced on the S4820T.                                       |
| 8.3.11.1 | Introduced on the Z9000.                                        |
| 8.3.7.0  | Introduced on the S4810.                                        |
| 7.6.1.0  | Introduced on the S-Series.                                     |
| 7.5.1.0  | Introduced on the C-Series.                                     |
| 6.1.1.0  | Added support for RADIUS.                                       |

## aaa authorization config-commands

Set parameters that restrict (or permit) a user's access to EXEC level commands.

### Syntax

```
aaa authorization config-commands
```

Disable authorization checking for CONFIGURATION level commands using the `no aaa authorization config-commands` command.

| <b>Defaults</b>          | Enabled when you configure <code>aaa authorization commands</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

| <b>Usage Information</b> | By default, the <code>aaa authorization commands</code> command configures the system to check both EXEC level and CONFIGURATION level commands. Use the command <code>no aaa authorization config-commands</code> to enable only EXEC-level command checking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

## aaa authorization exec

Set parameters that restrict (or permit) a user's access to EXEC-level commands.

| <b>name</b>       | Define a name for the list of authorization methods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |             |                                                      |                |                                                   |              |                                                                          |                |                                                    |             |                                                                |
| <b>default</b>    | Define the default list of authorization methods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |             |                                                      |                |                                                   |              |                                                                          |                |                                                    |             |                                                                |
| <b>local</b>      | Use the authorization parameters on the system to perform authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |             |                                                      |                |                                                   |              |                                                                          |                |                                                    |             |                                                                |
| <b>tacacs+</b>    | Use the TACACS+ protocol to perform authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |             |                                                      |                |                                                   |              |                                                                          |                |                                                    |             |                                                                |
| <b>none</b>       | Enter the keyword <code>none</code> to apply no authorization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |             |                                                      |                |                                                   |              |                                                                          |                |                                                    |             |                                                                |
| <b>Defaults</b>   | none                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |             |                                                      |                |                                                   |              |                                                                          |                |                                                    |             |                                                                |

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Added support for RADIUS.   |

## privilege level (CONFIGURATION mode)

Change the access or privilege level of one or more commands.

**Syntax** `privilege mode {level level command | reset command}`  
To delete access to a level and command, use the `no privilege mode level level command command`.

**Parameters**

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mode</b>        | Enter one of the following keywords as the mode for which you are controlling access: <ul style="list-style-type: none"><li>• <code>configure</code> for CONFIGURATION mode</li><li>• <code>exec</code> for EXEC mode</li><li>• <code>interface</code> for INTERFACE modes</li><li>• <code>line</code> for LINE mode</li><li>• <code>route-map</code> for ROUTE-MAP mode</li><li>• <code>router</code> for ROUTER OSPF, ROUTER RIP, ROUTER ISIS and ROUTER BGP modes</li></ul> |
| <b>level level</b> | Enter the keyword <code>level</code> then a number for the access level. The range is from 0 to 15. Level 1 is EXEC mode and Level 15 allows access to all CLI modes and commands.                                                                                                                                                                                                                                                                                             |
| <b>reset</b>       | Enter the keyword <code>reset</code> to return the security level to the default setting.                                                                                                                                                                                                                                                                                                                                                                                      |

|                          | <b><i>command</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Enter the command's keywords to assign the command to a certain access level. You can enter one or all of the keywords. |                |                    |                 |                             |                |                          |                 |                           |                 |                          |                |                          |                |                             |                |                             |                    |                             |

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

## Obscure Password Commands

To enable the obscure password, use the following commands.

### service obscure-passwords

Enable the obscuring of passwords and keys.

**Syntax**

```
service obscure-passwords
```

Enable the obscuring of passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication, use the `service obscure-passwords` command.

**Defaults**

Disabled.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                      |
|----------|------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                      |
| 9.6(0.0) | Introduced on the S4810, S4820T, S5000, S6000, Z9000, Z9500, MXL |

### Usage Information

By default, the `service password-encryption` command stores encrypted passwords. For greater security, you can also use the `service obscure-passwords` command to prevent a user from reading the passwords and keys, including RADIUS, TACACS+ keys, router authentication strings, VRRP authentication by obscuring this information. Passwords and keys are stored encrypted in the configuration file and by default are displayed in the encrypted form when the configuration is displayed. Enabling the `service obscure-passwords` command displays asterisks instead of the encrypted passwords and keys. This command prevents a user from reading these passwords and keys by obscuring this information with asterisks.

Password obscuring masks the password and keys for display only but does not change the contents of the file. The string of asterisks is the same length as the encrypted string for that line of configuration. To verify that you have successfully obscured passwords and keys, use the `show running-config` command or `show startup-config` command.

If you are using role-based access control (RBAC), only the system administrator and security administrator roles can enable the `service obscure-password` command.

### Related Commands

[show running-config](#)— Display the current configuration and display changes from the default values.

[service password-encryption](#)— Encrypts all passwords configured in the system.

## Authentication and Password Commands

To manage access to the system, use the following the commands.

### aaa authentication enable

Configure AAA Authentication method lists for user access to EXEC privilege mode (the “Enable” access).

**Syntax**                    `aaa authentication enable {default | method-list-name} method [... method2]`

To return to the default setting, use the `no aaa authentication enable {default | method-list-name} method [... method2]` command.

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>default</b>                 | Enter the keyword <code>default</code> then the authentication methods to use as the default sequence of methods for the Enable login. The default is <code>default enable</code> .                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>method-list-name</i></b> | Enter a text string (up to 16 characters long) to name the list of enabled authentication methods activated at login.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>method</i></b>           | Enter one of the following methods: <ul style="list-style-type: none"> <li>• <code>enable</code>: use the password the <code>enable password</code> command defines in CONFIGURATION mode.</li> <li>• <code>line</code>: use the password the <code>password</code> command defines in LINE mode.</li> <li>• <code>none</code>: no authentication.</li> <li>• <code>radius</code>: use the RADIUS servers configured with the <code>radius-server host</code> command.</li> <li>• <code>tacacs+</code>: use the TACACS+ server(s) configured with the <code>tacacs-server host</code> command.</li> </ul> |
| <b><i>... method2</i></b>      | (OPTIONAL) In the event of a “no response” from the first method, Dell Networking OS applies the next configured method.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Defaults

Use the `enable password`.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.0  | Introduced on the E-Series. |

## Usage Information

By default, the `Enable` password is used. If you configure `aaa authentication enable default`, Dell Networking OS uses the methods defined for `Enable` access instead.

Methods configured with the `aaa authentication enable` command are evaluated in the order they are configured. If authentication fails using the primary method, Dell Networking OS employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell Networking OS proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

## Related Commands

[enable password](#) — changes the password for the `enable` command.

[login authentication](#) — enables AAA login authentication on the terminal lines.

[password](#) — creates a password.

[radius-server host](#) — specifies a RADIUS server host.

[tacacs-server host](#) — specifies a TACACS+ server host.

## aaa authentication login

Configure AAA Authentication method lists for user access to EXEC mode (`Enable` log-in).

### S4820T

#### Syntax

```
aaa authentication login {method-list-name | default} method  
[... method4]
```

To return to the default setting, use the `no aaa authentication login {method-list-name | default}` command.

#### Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>method-list-name</i></b> | Enter a text string (up to 16 characters long) as the name of a user-configured method list that can be applied to different lines.                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>default</i></b>          | Enter the keyword <code>default</code> to specify that the method list specified is the default method for all terminal lines.                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>method</i></b>           | Enter one of the following methods: <ul style="list-style-type: none"><li>• <code>enable</code>: use the password the <code>enable password</code> command defines in CONFIGURATION mode. Not available if role-only is in use.</li><li>• <code>line</code>: use the password the <code>password</code> command defines in LINE mode. Not available if role-only is in use.</li><li>• <code>local</code>: use the password for the userid contained in the local password database.</li></ul> |

- none: no authentication. Not available if role-only is in use.
- radius: use the RADIUS servers configured with the radius-server host command.
- tacacs+: use the TACACS+ servers configured with the tacacs-server host command.

... **method4** (OPTIONAL) Enter up to four additional methods. In the event of a "no response" from the first method, the system applies the next configured method (up to four configured methods).

**Defaults** Not configured (that is, no authentication is performed).

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                     |
|-------------|-----------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                                     |
| 9.5(0.0)    | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL |
| 9.2(1.0)    | Introduced on the Z9500.                                        |
| 9.0.2.0     | Introduced on the S6000.                                        |
| 8.3.19.0    | Introduced on the S4820T.                                       |
| 8.3.11.1    | Introduced on the Z9000.                                        |
| 8.3.7.0     | Introduced on the S4810.                                        |
| 7.6.1.0     | Introduced on the S-Series.                                     |
| 7.5.1.0     | Introduced on the C-Series.                                     |
| pre-6.2.1.0 | Introduced on the E-Series.                                     |

**Usage Information** By default, the locally configured username password is used. If you configure `aaa authentication login default`, Dell Networking OS uses the methods this command defines for login instead.

Methods configured with the `aaa authentication login` command are evaluated in the order they are configured. If users encounter an error with the first method listed, Dell Networking OS applies the next method configured. If users fail the first method listed, no other methods are applied. The only exception is the local method. If the user's name is not listed in the local database, the next method is applied. If the correct user name/password combination is not entered, the user is not allowed access to the switch.

**NOTE:** If authentication fails using the primary method, Dell Networking OS employs the second method (or third method, if necessary) automatically. For example, if the TACACS+ server is reachable, but the server key is invalid, Dell Networking OS proceeds to the next authentication method. The TACACS+ is incorrect, but the user is still authenticated by the secondary method.

After configuring the `aaa authentication login` command, configure the `login authentication` command to enable the authentication scheme on terminal lines.

Connections to the SSH server work with the following login mechanisms: local, radius, and tacacs.

**Related Commands**

[login authentication](#) — enables AAA login authentication on the terminal lines.

[password](#) — creates a password.

[radius-server host](#) — specifies a RADIUS server host.

[tacacs-server host](#) — specifies a TACACS+ server host.

**access-class**

Restrict incoming connections to a particular IP address in a defined IP access control list (ACL).

**Syntax**

`access-class access-list-name`

To delete a setting, use the `no access-class` command.

**Parameters**

***access-list-name*** Enter the name of an established IP Standard ACL.

**Defaults**

Not configured.

**Command Modes**

LINE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.1 | Introduced on the E-Series. |

#### Related Commands

[line](#) — applies an authentication method list to the designated terminal lines.

[ip access-list standard](#) — names (or selects) a standard access list to filter based on the IP address.

[ip access-list extended](#) — names (or selects) an extended access list based on the IP addresses or protocols.

## enable password

Change the password for the `enable` command.

#### Syntax

```
enable password [level level] [encryption-type] password
```

To delete a password, use the `no enable password [encryption-type] password [level level]` command.

#### Parameters

**level *level*** (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.

***encryption-type*** (OPTIONAL) Enter the number 7 or 0 as the encryption type.

Enter a 7 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

Use this parameter only with a password that you copied from the `show running-config` file of another Dell Networking router.

***password*** Enter a text string, up to 32 characters long, as the clear text password.

#### Defaults

No password is configured. *level* = **15**.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |

| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Usage Information

To control access to command modes, use this command to define a password for a level and use the `privilege level (CONFIGURATION mode)` command.

Passwords must meet the following criteria:

- Start with a letter, not a number.
- Passwords can have a regular expression as the password. To create a password with a regular expression in it, use CNTL + v prior to entering regular expression. For example, to create the password `abcd]e`, you type `"abcd CNTL v ]e"`. When the password is created, you do not use the CNTL + v key combination and enter `"abcd]e"`.

**NOTE:** The question mark (?) and the tilde (~) are not supported characters.

### Related Commands

[show running-config](#) — views the current configuration.

[privilege level \(CONFIGURATION mode\)](#) — controls access to the command modes within the switch.

## enable restricted

Allows Dell Networking technical support to access restricted commands.

### Syntax

```
enable restricted [encryption-type] password
```

To disallow access to restricted commands, use the `no enable restricted` command.

### Parameters

***encryption-type***

(OPTIONAL) Enter the number 7 as the encryption type.

Enter 7 followed a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

Use this parameter only with a password that you copied from the `show running-config` file of another Dell Networking router.

***password*** Enter a text string, up to 32 characters long, as the clear text password.

**Defaults** Not configured.

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>     | <b>Description</b>          |
|--------------------|-----------------------------|
| <b>9.7(0.0)</b>    | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>     | Introduced on the S6000.    |
| <b>8.3.19.0</b>    | Introduced on the S4820T.   |
| <b>8.3.11.1</b>    | Introduced on the Z9000.    |
| <b>8.3.7.0</b>     | Introduced on the S4810.    |
| <b>7.6.1.0</b>     | Introduced on the S-Series. |
| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

**Usage Information** Only Dell Networking Technical Support staff use this command.

## **enable secret**

Change the password for the `enable` command.

**Syntax** `enable secret [level level] [encryption-type] password`  
To delete a password, use the `no enable secret [encryption-type] password [level level]` command.

**Parameters**

***level level*** (OPTIONAL) Enter the keyword `level` then a number as the level of access. The range is from 1 to 15.

***encryption-type*** (OPTIONAL) Enter the number 5 or 0 as the encryption type.  
Enter a 5 then a text string as the hidden password. The text string must be a password that was already encrypted by a Dell Networking router.

Use this parameter only with a password that you copied from the `show running-config` file of another Dell Networking router.

**password** Enter a text string, up to 32 characters long, as the clear text password.

#### Defaults

No password is configured. *level* = **15**.

[privilege level \(CONFIGURATION mode\)](#) — controls access to the command modes within the switch.

## login authentication

To configure authentication for console or remote access, apply an authentication method list.

**Syntax** `login authentication {method-list-name | default}`  
To use the local user/password database for login authentication, use the `no login authentication` command.

**Parameters**

|                                |                                                                                                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>method-list-name</i></b> | Enter the keywords <code>method-list-name</code> to specify that method list, created in the <code>aaa authentication login</code> command, to be applied to the designated terminal line. |
| <b>default</b>                 | Enter the keyword <code>default</code> to specify that the default method list, created in the <code>aaa authentication login</code> command, is applied to the terminal line.             |

**Defaults** No authentication is performed on the console lines. Local authentication is performed on the virtual terminal and auxiliary lines.

**Command Modes** LINE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                            |
|-------------|--------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                            |
| 9.6.0.0     | Revised introductory and usage guidelines description. |
| 9.0.2.0     | Introduced on the S6000.                               |
| 8.3.19.0    | Introduced on the S4820T.                              |
| 8.3.11.1    | Introduced on the Z9000.                               |
| 8.3.7.0     | Introduced on the S4810.                               |
| 7.6.1.0     | Introduced on the S-Series.                            |
| 7.5.1.0     | Introduced on the C-Series.                            |
| pre-6.2.1.0 | Introduced on the E-Series.                            |

**Usage Information** When configuring authentication, consider the following:

- If you configure the default authentication list using the `default` keyword, the list applies it to all the local and remote connections globally, unless you have specified some another authentication list for a specific connection.

- If you configure an authentication lists other than default, you must apply those authentication lists to each connection.
- If you configure the `aaa authentication login default` command, the `login authentication default` command automatically is applied to all terminal lines.

**Related  
Commands**

[aaa authentication login](#) — selects the login authentication methods.

## password

Specify a password for users on terminal lines.

**Syntax**

`password [encryption-type] password`

To delete a password, use the `no password password` command.

**Parameters**

***encryption-type***

(OPTIONAL) Enter either zero (0) or 7 as the encryption type for the password entered. The options are

- 0 is the default and means the password is not encrypted and stored as clear text.
- 7 means that the password is encrypted and hidden.

***password***

Enter a text string up to 32 characters long. The first character of the password must be a letter. You cannot use spaces in the password.

**Defaults**

No password is configured.

**Command  
Modes**

LINE

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information**

Dell Networking OS prompts users for these passwords when the method for authentication or authorization used is "line".

**Related Commands**

- [enable password](#) — sets the password for the `enable` command.
- [login authentication](#) — configures an authentication method to log in to the switch.
- [service password-encryption](#) — encrypts all passwords configured in Dell Networking OS .
- [radius-server key](#) — configures a key for all RADIUS communications between the switch and the RADIUS host server.
- [tacacs-server key](#) — configures a key for communication between a TACACS+ server and client.
- [username](#) — establishes an authentication system based on user names.

## password-attributes

Configure the password attributes (strong password).

**Syntax**

```
password-attributes [min-length number] [max-retry number]
[lockout-period minutes] [character-restriction [upper number]
[lower number] [numeric number] [special-char number]]
To return to the default, use the no password-attributes [min-length
number] [max-retry number] [lockout-period minutes] [character-
restriction [upper number] [lower number] [numeric number]
[special-char number]] command.
```

**Parameters**

- min-length *number*** (OPTIONAL) Enter the keywords `min-length` then the number of characters. The range is from 0 to 32 characters.
- max-retry *number*** (OPTIONAL) Enter the keywords `max-retry` then the number of maximum password retries. The range is from 0 to 16.
- lockout-period *minutes*** (OPTIONAL) Enter the keyword `lockout-period` then the number of minutes. The range is from 1 to 1440 minutes. The default is 0 minutes and the lockout-period is not enabled. This parameter enhances the security of the switch by locking out sessions on the Telnet or SSH sessions for which there has been a consecutive failed login attempts. The console is not locked out.

|                              |                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>character-restriction</b> | (OPTIONAL) Enter the keywords <code>character-restriction</code> to indicate a character restriction for the password.                                                                                                                                       |
| <b>upper number</b>          | (OPTIONAL) Enter the keyword <code>upper</code> then the upper number. The range is from 0 to 31.                                                                                                                                                            |
| <b>lower number</b>          | (OPTIONAL) Enter the keyword <code>lower</code> then the lower number. The range is from 0 to 31.                                                                                                                                                            |
| <b>numeric number</b>        | (OPTIONAL) Enter the keyword <code>numeric</code> then the numeric number. The range is from 0 to 31.                                                                                                                                                        |
| <b>special-char number</b>   | (OPTIONAL) Enter the keywords <code>special-char</code> then the number of special characters permitted. The range is from 0 to 31.<br>The following special characters are supported:<br><br>! " # % & ' ( ) ; < = > ? [ \ ] * + , - . / : ^ _ {   } ~ @ \$ |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                |
|----------|--------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                |
| 9.5(0.0) | Introduced <code>lockout-period</code> option on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                                                   |
| 9.0.2.0  | Introduced on the S6000.                                                                   |
| 8.3.19.0 | Introduced on the S4820T.                                                                  |
| 8.3.11.1 | Introduced on the Z9000.                                                                   |
| 8.3.7.0  | Introduced on the S4810.                                                                   |
| 7.6.1.0  | Introduced on the S-Series.                                                                |
| 7.5.1.0  | Introduced on the C-Series.                                                                |
| 6.3.1.0  | Introduced on the E-Series.                                                                |

**Related Commands**

[password](#) — specifies a password for users on terminal lines.

## service password-encryption

Encrypt all passwords configured in Dell Networking OS.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>service password-encryption</code><br>To store new passwords as clear text, use the <code>no service password-encryption</code> command.                 |
| <b>Defaults</b>        | Enabled.                                                                                                                                                       |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Usage Information

**CAUTION: Encrypting passwords with this command does not provide a high level of security. When the passwords are encrypted, you cannot return them to plain text unless you re-configure them. To remove an encrypted password, use the `no password password` command.**

To keep unauthorized people from viewing passwords in the switch configuration file, use the `service password-encryption` command. This command encrypts the clear-text passwords created for user name passwords, authentication key passwords, the privileged command password, and console and virtual terminal line access passwords.

To view passwords, use the `show running-config` command.

## show privilege

View your access level.

**Syntax**                    `show privilege`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**        This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Example**

```
Dell#show privilege
Current privilege level is 15.
Dell#
```

```
Dell#show privilege
Current privilege level is 14.
Dell#
Dell#show privilege
Current privilege level is 10.
Dell#
```

**Related Commands**        [privilege level \(CONFIGURATION mode\)](#) — assigns access control to different command modes.

## show users

Allows you to view information on all users logged in to the switch.

**Syntax**                    `show users [all]`

**Parameters**                **all**                    (OPTIONAL) Enter the keyword `all` to view all terminal lines in the switch.

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                      |
|-------------|------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                                      |
| 9.5(0.0)    | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL. |
| 9.2(1.0)    | Introduced on the Z9500.                                         |
| 9.0.2.0     | Introduced on the S6000.                                         |
| 8.3.19.0    | Introduced on the S4820T.                                        |
| 8.3.11.1    | Introduced on the Z9000.                                         |
| 8.3.7.0     | Introduced on the S4810.                                         |
| 7.6.1.0     | Introduced on the S-Series.                                      |
| 7.5.1.0     | Introduced on the C-Series.                                      |
| pre-6.1.1.0 | Introduced on the E-Series.                                      |

**Usage Information**

The following describes the `show user` command shown in the following example.

| Field      | Description                                                       |
|------------|-------------------------------------------------------------------|
| (untitled) | Indicates with an asterisk (*) which terminal line you are using. |
| Line       | Displays the terminal lines currently in use.                     |
| User       | Displays the user name of all users logged in.                    |
| Host(s)    | Displays the terminal line status.                                |
| Location   | Displays the IP address of the user.                              |

**Example**

```
Dell# show users
Authorization Mode:  role or privilege
                    User
Role   Line           Priv Host(s)    Location
*  0   console 0      1   idl
unassigned
   2   vty 0       1   admin
unassigned
   3   vty 1       15  ad
unassigned
   4   vty 2       1   ad1
sysadmin
   5   vty 3       1   ad1

   7   vty 5       15  ad1
unassigned
   8   vty 6       1   admin
unassigned
```

```

unassigned          1  idle      10.16.127.141
   7 vty 5          ad
unassigned          15 idle      10.16.127.141
Dell#

```

**Related Commands**      [username](#) — enables a user.

## timeout login response

Specify how long the software waits for the login input (for example, the user name and password) before timing out.

**Syntax**                    `timeout login response seconds`  
 To return to the default values, use the `no timeout login response` command.

**Parameters**

***seconds***                    Enter a number of seconds the software waits before logging you out. The range is:

- VTY: the range is from 1 to 30 seconds, the default is **30 seconds**.
- Console: the range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).
- AUX: the range is from 1 to 300 seconds, the default is **0 seconds** (no timeout).

**Defaults**                    See the defaults settings shown in *Parameters*.

**Command Modes**            LINE

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version     | Description                 |
|-------------|-----------------------------|
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information**

The software measures the period of inactivity defined in this command as the period between consecutive keystrokes. For example, if your password is "password" you can enter "p" and wait 29 seconds to enter the next letter.

**username**

Establish an authentication system based on user names.

**Syntax**

```
username name [access-class access-list-name] [nopassword |
{password | secret} [encryption-type] password] [privilege
level] [role role-name]
```

If you do not want a specific user to enter a password, use the `nopassword` option.

To delete authentication for a user, use the `no username name` command.

**Parameters**

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>                          | Enter a text string for the name of the user up to 63 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>access-class access-list-name</b> | Enter the keywords <code>access-class</code> then the name of a configured access control list (either an IP access control list or MAC access control list).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>nopassword</b>                    | Enter the keyword <code>nopassword</code> to specify that the user should not enter a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>password</b>                      | Enter the keyword <code>password</code> then the <code>encryption-type</code> or the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>secret</b>                        | Enter the keyword <code>secret</code> then the <code>encryption-type</code> or the password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>encryption-type</b>               | Enter an encryption type for the <code>password</code> that you enter. <ul style="list-style-type: none"> <li>• 0 directs the system to store the password as clear text. It is the default encryption type when using the <code>password</code> option.</li> <li>• 7 to indicate that a password encrypted using a DES hashing algorithm follows. This encryption type is available with the <code>password</code> option only.</li> <li>• 5 to indicate that a password encrypted using an MD5 hashing algorithm follows. This encryption type is available with the <code>secret</code> option only, and is the default encryption type for this option.</li> </ul> |
| <b>password</b>                      | Enter a string up to 32 characters long.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>privilege level</b>               | Enter the keyword <code>privilege</code> then a number from zero (0) to 15.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**role *role-name*** Enter the keyword `role` followed by the role name to associate with that user ID.

**secret** Enter the keyword `secret` then the encryption type.

**Defaults**

The default encryption type for `password` option is **0**. The default encryption type for `secret` option is **0**. The default value of `privilege level` is **1**.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                                                                   |
|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                                                                                                   |
| 9.5(0.0)    | Added support for roles on the Z9000, S6000, S4820T, S4810, MXL.                                                              |
| 9.2(1.0)    | Introduced on the Z9500.                                                                                                      |
| 9.0.2.0     | Introduced on the S6000.                                                                                                      |
| 8.3.19.0    | Introduced on the S4820T.                                                                                                     |
| 8.3.11.1    | Introduced on the Z9000.                                                                                                      |
| 8.3.7.0     | Introduced on the S4810.                                                                                                      |
| 7.7.1.0     | Added support for the <code>secret</code> option and the MD5 password encryption. Extended the name from 25 to 63 characters. |
| 7.6.1.0     | Introduced on the S-Series.                                                                                                   |
| 7.5.1.0     | Introduced on the C-Series.                                                                                                   |
| pre-6.1.1.0 | Introduced on the E-Series.                                                                                                   |

**Usage Information**

To view the defined user names, use the `show running-config user` command.

**Related Commands**

- [password](#) — specifies a password for users on terminal lines.
- [show running-config](#) — views the current configuration.

# RADIUS Commands

The following RADIUS commands are supported by Dell Networking OS.

## aaa radius group

Configure the RADIUS server group that is used for Authentication, Authorization and Accounting.

**Syntax** `aaa radius group group-name`  
To remove the RADIUS group configuration, use the `no aaa radius group group-name` command.

**Parameters** `group-name` Enter the name of the RADIUS server group.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.              |
| 9.4.(0.0) | Introduced on the S-Series and Z-Series. |

**Usage Information** You can use this command to configure the group of Radius servers used for Authentication, Authorization, and Accounting purposes.

If the RADIUS group is not configured for Authentication, Authorization, and Accounting, then globally configured Radius servers are used for the purposes.

When the RADIUS group is removed, the AAA configuration is also removed.

## Example

## debug radius

View RADIUS transactions to assist with troubleshooting.

**Syntax** `debug radius`  
To disable debugging of RADIUS, use the `no debug radius` command.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Disabled.                                                                                                                                                      |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.0 | Introduced on the E-Series. |

## ip radius source-interface

Specify an interface's IP address as the source IP address for RADIUS connections.

|               |                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>ip radius source-interface <i>interface</i></code><br>To delete a source interface, use the <code>no ip radius source-interface</code> command. |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>interface</i></b> | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
|-------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | Not configured.                                                                                                                                                |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                          |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.0 | Introduced on the E-Series.                          |

## radius-server deadline

Configure a time interval during which non-responsive RADIUS servers to authentication requests are skipped.

|               |                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>radius-server deadline <i>seconds</i></code><br>To disable this function or return to the default value, use the <code>no radius-server deadline</code> command. |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b><i>seconds</i></b> Enter a number of seconds during which non-responsive RADIUS servers are skipped. The range is from 0 to 2147483647 seconds. The default is <b>0 seconds</b> . |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Defaults</b>        | <b>0 seconds</b>                                                                                                                                               |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

## radius-server group

Creates or deletes a group of radius servers.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>radius-server group <i>group-name</i></code>                                                                                                             |
| <b>Parameters</b>      | <p><b><i>group-name</i></b> Enter the group name that denotes the group of RADIUS servers.</p>                                                                 |
| <b>Defaults</b>        | Not configured.                                                                                                                                                |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000–ON.              |
| 9.4.(0.0) | Introduced on the S-Series and Z-Series. |

### Example

```
Dell(conf)#radius-server group group1
Dell(conf-radius-group)#radius-server host 1.1.1.1 key secret
Dell(conf-radius-group)#radius-server host 2.2.2.2 key secret
Dell(conf-radius-group)#radius-server vrf vrf1 source-
interface tengigabitethernet 1/36
Dell(conf-radius-group)#show config
!
radius-server group group1
radius-server vrf vrf1 source-interface TenGigabitEthernet
1/36
radius-server host 1.1.1.1 key 7 9a2f3ec0c65c6f41
radius-server host 2.2.2.2 key 7 9a2f3ec0c65c6f41
Dell(conf-radius-group)#
```

## Related Commands

[login authentication](#) — sets the database to be checked when a user logs in.

[radius-server key](#) — sets an authentication key for RADIUS communications.

[radius-server retransmit](#) — sets the number of times the RADIUS server attempts to send information.

[radius-server timeout](#) — sets the time interval before the RADIUS server times out.

## radius-server host

Configure a RADIUS server host.

### Syntax

```
radius-server host {hostname | ipv4-address | ipv6-address}  
[auth-port port-number] [retransmit retries] [timeout seconds]  
[key [encryption-type] key]
```

### Parameters

|                                           |                                                                                                                                                                                                                                                                                    |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hostname</b>                           | Enter the name of the RADIUS server host.                                                                                                                                                                                                                                          |
| <b>ipv4-address  <br/>ipv6-address</b>    | Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X::X) of the RADIUS server host.                                                                                                                                                                                             |
| <b>auth-port port-<br/>number</b>         | (OPTIONAL) Enter the keywords <code>auth-port</code> then a number as the port number. The range is from zero (0) to 65535. The default port-number is <b>1812</b> .                                                                                                               |
| <b>retransmit<br/>retries</b>             | (OPTIONAL) Enter the keyword <code>retransmit</code> then a number as the number of attempts. This parameter overwrites the <code>radius-server retransmit</code> command. The range is from zero (0) to 100. The default is <b>3 attempts</b> .                                   |
| <b>timeout<br/>seconds</b>                | (OPTIONAL) Enter the keyword <code>timeout</code> then the seconds the time interval the switch waits for a reply from the RADIUS server. This parameter overwrites the <code>radius-server timeout</code> command. The range is from 0 to 1000. The default is <b>5 seconds</b> . |
| <b>key<br/>[encryption-<br/>type] key</b> | (OPTIONAL) Enter the keyword <code>key</code> then an optional encryption-type and a string up to 42 characters long as the authentication key. The RADIUS host server uses this authentication key and the RADIUS daemon operating on this switch.                                |

For the encryption-type, enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the password is not encrypted and stored as clear text.
- 7 means that the password is encrypted and hidden.

Configure this parameter last because leading spaces are ignored.

**Defaults** Not configured.

**Command Modes**

- RADIUS SERVER GROUP
- CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                           |
| 9.0.2.0     | Introduced on the S6000.                              |
| 8.3.19.0    | Introduced on the S4820T.                             |
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.4.1.0     | Added support for IPv6.                               |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.0 | Introduced on the E-Series.                           |

**Usage Information** To configure any number of RADIUS server hosts for each server host that is configured, use this command. Dell Networking OS searches for the RADIUS hosts in the order they are configured in the software.

The global default values for the `timeout`, `retransmit`, and `key` optional parameters are applied, unless those values are specified in the `radius-server host` or other commands. To return to the global default values, if you configure the `timeout`, `retransmit`, or `key` values, include those keywords when using the `no radius-server host` command syntax.

You can use duplicate host names or IP addresses among RADIUS groups. However, you cannot use duplicate host names or IP addresses within the same RADIUS group. If a VRF is not configured on the RADIUS group, then servers configured in the group are considered to be on the default VRF. RADIUS servers that are configured in the CONFIGURATION mode are also considered to be on the default VRF.

You must configure the RADIUS group explicitly with the `aaa radius group` command in order for the AAA servers to use the group of RADIUS servers. The 802.1x servers use the group of RADIUS servers based on the VRF where the 802.1x request is received. As a result, it is possible that both globally configured RADIUS servers as well as the group-configured RADIUS servers (without VRF or default VRF) are used for processing the 802.1x requests that are received at the default

VRF. The order in which the RADIUS servers are tried depends on the order in which the RADIUS servers are configured.

#### Example

```
Dell(conf)#radius-server group group1
Dell(conf-radius-group)#radius-server host 1.1.1.1 key secret
Dell(conf-radius-group)#no radius-server host 1.1.1.1
```

#### Related Commands

[login authentication](#) — sets the database to be checked when a user logs in.

[radius-server key](#) — sets an authentication key for RADIUS communications.

[radius-server retransmit](#) — sets the number of times the RADIUS server attempts to send information.

[radius-server timeout](#) — sets the time interval before the RADIUS server times out.

## radius-server key

Configure a key for all RADIUS communications between the switch and the RADIUS host server.

#### Syntax

```
radius-server key [encryption-type] key
```

To delete a password, use the `no radius-server key` command.

#### Parameters

***encryption-type***

(OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the key is not encrypted and stored as clear text.
- 7 means that the key is encrypted and hidden.

***key***

Enter a string that is the key to be exchanged between the switch and RADIUS servers. It can be up to 42 characters long.

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 8.3.19.0    | Introduced on the S4820T.                             |
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.0 | Introduced on the E-Series.                           |

**Usage Information**

The key configured on the switch must match the key configured on the RADIUS server daemon.

If you configure the `key` parameter in the `radius-server host` command, the key configured with the `radius-server key` command is the default key for all RADIUS communications.

**Related Commands**

[radius-server host](#) — configures a RADIUS host.

## radius-server retransmit

Configure the number of times the switch attempts to connect with the configured RADIUS host server before declaring the RADIUS host server unreachable.

**Syntax**

`radius-server retransmit retries`

To configure zero retransmit attempts, use the `no radius-server retransmit` command.

To return to the default setting, use the `radius-server retransmit 3` command.

**Parameters**

***retries*** Enter a number of attempts that FTOS tries to locate a RADIUS server. The range is from zero (0) to 100. The default is **3 retries**.

**Defaults**

**3 retries**

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.0 | Introduced on the E-Series. |

**Related Commands**      [radius-server host](#) — configures a RADIUS host.

## radius-server timeout

To reply to a request, configure the amount of time the RADIUS client (the switch) waits for a RADIUS host server .

**Syntax**                    `radius-server timeout seconds`  
 To return to the default value, use the `no radius-server timeout` command.

**Parameters**                **seconds**                    Enter the number of seconds between an unsuccessful attempt and the Dell Networking OS times out. The range is from zero (0) to 1000 seconds. The default is **5 seconds**.

**Defaults**                    **5 seconds**

**Related Commands**      [radius-server host](#) — configures a RADIUS host.

## radius-server vrf

Create an association between a RADIUS server group and a VRF and source interface.

ud

**Syntax**                    `radius-server vrf vrf-name [source-interface interface]`  
 To delete the association between a RADIUS server group and a VRF and source interface, use the `no radius-server vrf vrf-name [source-interface interface]` command.

### Parameters

- |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf <i>vrf-name</i></b> | Enter the keyword <code>vrf</code> and then the name of the VRF to associate a RADIUS server group with that VRF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>interface</i></b>    | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>• For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>• For a Null interface, enter the keyword <code>null</code> then the Null interface number.</li> <li>• For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |

**Defaults**                    Not configured.

**Command Modes**            RADIUS SERVER GROUP

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.5(0.0) | Introduced on the Z9500.              |
| 9.4(0.0) | Introduced on the S-Series and Z9000. |

#### Usage Information

You can use this command to associate a group of RADIUS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the RADIUS group, then the group is considered to be on the default VRF. It is possible to use the default VRF name; however, you cannot configure the source interface with the default VRF as such a configuration results in conflicts between the source interfaces corresponding to the 802.1x supplicants on that default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

#### Example

```
Dell(conf)#radius-server group group1
Dell(conf-radius-group)#radius-server vrf vrf1 source-
interface tengigabitethernet 1/40
```

```
Dell(conf)#radius-server group group2
Dell(conf-radius-group)#radius-server vrf default
```

## TACACS+ Commands

Dell Networking OS supports TACACS+ as an alternate method for login authentication.

### **tacacs-server group**

Creates a group of TACACS servers to be used for Authentication, Authorization, and Accounting..

#### Syntax

```
aaa tacacsgroup group-name
```

To delete a group of TACACS servers, use the `no tacacs-server group group-name` command

#### Parameters

***group-name*** Enter the name of the TACACS server group.

| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                             |           |                                          |

| Version     | Description                 |
|-------------|-----------------------------|
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.2.1.0 | Introduced on the E-Series. |

## ip tacacs source-interface

Specify an interface's IP address as the source IP address for TACACS+ connections.

**Syntax** `ip tacacs source-interface interface`  
 To delete a source interface, use the `no ip tacacs source-interface` command.

**Parameters**

***interface*** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                          |
|-------------|------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                          |
| 9.0.2.0     | Introduced on the S6000.                             |
| 8.3.19.0    | Introduced on the S4820T.                            |
| 8.3.11.1    | Introduced on the Z9000.                             |
| 8.5.1.0     | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0     | Introduced on the S4810.                             |
| 7.6.1.0     | Introduced on the S-Series.                          |
| 7.5.1.0     | Introduced on the C-Series.                          |
| pre-6.2.1.1 | Introduced on the E-Series.                          |

## tacacs-server group

Creates a group of TACACS servers.

**Syntax** `tacacs-server group group-name`

To delete a group of TACACS servers, use the `no tacacs-server group group-name` command.

**Parameters** **group-name** Enter the name of the TACACS server group.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000–ON.              |
| 9.4.(0.0) | Introduced on the S-Series and Z-Series. |

**Usage Information** You can associate a TACACS server group with a VRF.

**Example**

```
Dell(conf)#tacacs-server group group1
Dell(conf-tacacs-group)#tacacs-server host 1.1.1.1 key secret
Dell(conf-tacacs-group)#tacacs-server host 2.2.2.2 key secret
Dell(conf-tacacs-group)#tacacs-server vrf vrf1 source-
interface tengigabitethernet 1/42
Dell(conf-tacacs-group)#show config
!
tacacs-server group group1
```

```
tacacs-server vrf vrf1 source-interface TenGigabitEthernet 1/42
tacacs-server host 1.1.1.1 key 7 9a2f3ec0c65c6f41
tacacs-server host 2.2.2.2 key 7 9a2f3ec0c65c6f41
Dell(conf-tacacs-group)#
```

**Related  
Commands**

[aaa authentication login](#) — specifies the login authentication method.

[tacacs-server key](#) — configures a TACACS+ key for the TACACS server.

## tacacs-server host

Specify a TACACS+ host.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>tacacs-server host {hostname   ipv4-address   ipv6-address} [port number] [timeout seconds] [key key]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Parameters</b>      | <p><b>hostname</b> Enter the name of the TACACS+ server host.</p> <p><b>ipv4-address   ipv6-address</b> Enter the IPv4 address (A.B.C.D) or IPv6 address (X:X:X::X) of the TACACS+ server host.</p> <p><b>port number</b> (OPTIONAL) Enter the keyword <code>port</code> then a number as the port to be used by the TACACS+ server. The range is from zero (0) to 65535. The default is <b>49</b>.</p> <p><b>timeout seconds</b> (OPTIONAL) Enter the keyword <code>timeout</code> then the number of seconds the switch waits for a reply from the TACACS+ server. The range is from 0 to 1000. The default is <b>10 seconds</b>.</p> <p><b>key key</b> (OPTIONAL) Enter the keyword <code>key</code> then a string up to 42 characters long as the authentication key. This authentication key must match the key specified in the <code>tacacs-server key</code> for the TACACS+ daemon.</p> |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.4.1.0     | Added support for IPv6.                               |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.1 | Introduced on the E-Series.                           |

### Usage Information

To list multiple TACACS+ servers to be used by the `aaa authentication login` command, configure this command multiple times.

If you are not configuring the switch as a TACACS+ server, you do not need to configure the `port`, `timeout` and `key` optional parameters. If you do not configure a key, the key assigned in the `tacacs-server key` command is used.

You can use duplicate host names or IP addresses among TACACS groups. However, you cannot use duplicate host names or IP addresses within the same TACACS group.

If a VRF is not configured on the TACACS group, then servers configured in the group are considered to be on the default VRF. TACACS servers that are configured in the CONFIGURATION mode are also considered to be on the default VRF.

For AAA servers to use a group of TACACS servers, you must explicitly configure the group using the `aaa tacacs group group-name` command. The order in which the TACACS servers are tried depends on the order in which they are configured.

### Example

```
Dell(conf)#tacacs-server group group1
Dell(conf-tacacs-group)#tacacs-server host 1.1.1.1 key secret
Dell(conf-tacacs-group)#no tacacs-server host 1.1.1.1
```

### Related Commands

[aaa authentication login](#) — specifies the login authentication method.

[tacacs-server key](#) — configures a TACACS+ key for the TACACS server.

## tacacs-server vrf

Create an association between a TACACS server group and a VRF and source interface.

**Syntax** `tacacs-server vrf vrf-name [source-interface interface]`

To delete the association between a TACACS server group and a VRF and source interface, use the `no tacacs-server vrf vrf-name [source-interface interface]` command.

#### Parameters

- vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to associate a TACACS server group with that VRF.
- interface** Enter the following keywords and slot/port or number information:
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
  - For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
  - For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
  - For a port channel interface, enter the keywords `port-channel` then a number.
  - For a Null interface, enter the keyword `null` then the Null interface number.
  - For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

#### Defaults

Not configured.

#### Command Modes

TACACS SERVER GROUP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                              |
|-----------|------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.              |
| 9.4.(0.0) | Introduced on the S-Series and Z-Series. |

#### Usage Information

You can use this command to associate a group of TACACS servers with a VRF and source interface. You can configure the source interface only with the VRF attribute and source interface is optional with the VRF attributes.

If VRF is not configured on the TACACS group, then the group is considered to be on the default VRF.

RADIUS groups and VRFs have one-to-one mapping. If a VRF is configured with one RADIUS group, then you cannot use the same VRF with another RADIUS group. When the VRF is removed, then the corresponding RADIUS group is also removed automatically.

## Example

```
Dell(conf)#tacacs-server group group1
Dell(conf-tacacs-group)#tacacs-server vrf vrf1 source-
interface tengigabitethernet 1/36

Dell(conf)#tacacs-server group group2
Dell(conf-tacacs-group)#tacacs-server vrf default
```

## tacacs-server key

Configure a key for communication between a TACACS+ server and a client.

### Syntax

```
tacacs-server key [encryption-type] key
```

To delete a key, use the `no tacacs-server key key` command.

### Parameters

#### *encryption-type*

(OPTIONAL) Enter either zero (0) or 7 as the encryption type for the key entered. The options are:

- 0 is the default and means the key is not encrypted and stored as clear text.
- 7 means that the key is encrypted and hidden.

#### *key*

Enter a text string, up to 42 characters long, as the clear text password. Leading spaces are ignored.

### Defaults

Not configured.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                           |
|-------------|-------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.                           |
| 9.0.2.0     | Introduced on the S6000.                              |
| 8.3.19.0    | Introduced on the S4820T.                             |
| 8.3.11.1    | Introduced on the Z9000.                              |
| 8.3.7.0     | Introduced on the S4810.                              |
| 7.7.1.0     | Authentication key length increased to 42 characters. |
| 7.6.1.0     | Introduced on the S-Series.                           |
| 7.5.1.0     | Introduced on the C-Series.                           |
| pre-6.2.1.1 | Introduced on the E-Series.                           |

**Usage Information** The key configured with this command must match the key configured on the TACACS+ daemon.

## Port Authentication (802.1X) Commands

An authentication server must authenticate a client connected to an 802.1X switch port. Until the authentication, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed through the port to which a client is connected. After authentication is successful, normal traffic passes through the port.

Dell Networking OS supports RADIUS and Active Directory environments using 802.1X Port Authentication.

### Important Points to Remember

Dell Networking OS limits network access for certain users by using VLAN assignments. 802.1X with VLAN assignment has these characteristics when configured on the switch and the RADIUS server.

- 802.1X is supported on Dell Networking OS.
- 802.1X is not supported on the LAG or the channel members of a LAG.
- If no VLAN is supplied by the RADIUS server or if 802.1X authorization is disabled, the port is configured in its access VLAN after successful authentication.
- If 802.1X authorization is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the Unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error. Configuration errors create an entry in Syslog.
- If 802.1X authorization is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If port security is enabled on an 802.1X port with VLAN assignment, the port is placed in the RADIUS server assigned VLAN.
- If 802.1X is disabled on the port, it is returned to the configured access VLAN.
- When the port is in the Force Authorized, Force Unauthorized, or Shutdown state, it is placed in the configured access VLAN.
- If an 802.1X port is authenticated and put in the RADIUS server assigned VLAN, any change to the port access VLAN configuration does not take effect.
- The 802.1X with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN membership.

### dot1x authentication (Configuration)

Enable dot1x globally; dot1x must be enabled both globally and at the interface level.

**Syntax** `dot1x authentication`  
To disable dot1x on globally, use the `no dot1x authentication` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

**Related Commands** [dot1x authentication \(Interface\)](#) — enables dot1x on an interface.

## dot1x authentication (Interface)

Enable dot1x on an interface; dot1x must be enabled both globally and at the interface level.

**Syntax** `dot1x authentication`  
To disable dot1x on an interface, use the `no dot1x authentication` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 7.4.1.0 | Introduced on the E-Series. |

**Related Commands** [dot1x authentication \(Configuration\)](#) — enables dot1x globally.

## dot1x auth-fail-vlan

Configure an authentication failure VLAN for users and devices that fail 802.1X authentication.

**Syntax** `dot1x auth-fail-vlan vlan-id [max-attempts number]`  
 To delete the authentication failure VLAN, use the `no dot1x auth-fail-vlan vlan-id [max-attempts number]` command.

**Parameters**

|                                   |                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vlan-id</i></b>             | Enter the VLAN Identifier. The range is from 1 to 4094.                                                                                                                  |
| <b>max-attempts <i>number</i></b> | (OPTIONAL) Enter the keywords <code>max-attempts</code> then number of attempts desired before authentication fails. The range is from 1 to 5. The default is <b>3</b> . |

**Defaults** **3 attempts**

**Command Modes** CONFIGURATION (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                         |
|----------|-----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                         |
| 9.0.2.0  | Introduced on the S6000.                            |
| 8.3.19.0 | Introduced on the S4820T.                           |
| 8.3.7.0  | Introduced on the S4810.                            |
| 7.6.1.0  | Introduced on the C-Series, S-Series, and E-Series. |

**Usage Information** If the host responds to 802.1X with an incorrect login/password, the login fails. The switch attempts to authenticate again until the maximum attempts configured is reached. If the authentication fails after all allowed attempts, the interface is moved to the authentication failed VLAN.

After the authentication VLAN is assigned, the port-state must be toggled to restart authentication. Authentication occurs at the next re-authentication interval (`dot1x reauthentication`).

**Related  
Commands**

[dot1x port-control](#) — enables port-control on an interface.

[dot1x guest-vlan](#) — configures a guest VLAN for non-dot1x devices.

[show dot1x interface](#) — displays the 802.1X information on an interface.

## dot1x auth-server

Configure the authentication server to RADIUS.

**Syntax** `dot1x auth-server radius`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

## dot1x guest-vlan

Configure a guest VLAN for limited access users or for devices that are not 802.1X capable.

**Syntax** `dot1x guest-vlan vlan-id`  
To disable the guest VLAN, use the `no dot1x guest-vlan vlan-id` command.

**Parameters** ***vlan-id*** Enter the VLAN Identifier. The range is from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION (conf-if-interface-slot/port)

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                         |
|----------|-----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.                         |
| 9.0.2.0  | Introduced on the S6000.                            |
| 8.3.19.0 | Introduced on the S4820T.                           |
| 8.3.11.1 | Introduced on the Z9000.                            |
| 8.3.7.0  | Introduced on the S4810.                            |
| 7.6.1.0  | Introduced on the C-Series, S-Series, and E-Series. |

## Usage Information

802.1X authentication is enabled when an interface is connected to the switch. If the host fails to respond within a designated amount of time, the authenticator places the port in the guest VLAN.

If a device does not respond within 30 seconds, it is assumed that the device is not 802.1X capable. Therefore, a guest VLAN is allocated to the interface and authentication for the device occurs at the next re-authentication interval (`dot1x reauthentication`).

If the host fails authentication for the designated number of times, the authenticator places the port in authentication failed VLAN (`dot1x auth-fail-vlan`).

**NOTE:** The layer 3 portion of guest VLAN and authentication fail VLANs can be created regardless if the VLAN is assigned to an interface or not. After an interface is assigned a guest VLAN (which has an IP address), routing through the guest VLAN is the same as any other traffic. However, the interface may join/leave a VLAN dynamically.

## Related Commands

[dot1x auth-fail-vlan](#) — configures a VLAN for authentication failures.

[dot1x reauthentication](#) — enables periodic re-authentication.

[show dot1x interface](#) — displays the 802.1X information on an interface.

## dot1x mac-auth-bypass

Enable MAC authentication bypass. If 802.1X times out because the host did not respond to the Identity Request frame, Dell Networking OS attempts to authenticate the host based on its MAC address.

**Syntax**                    `[no] dot1x mac-auth-bypass`

**Defaults**                 Disabled

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.4 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.4.1.0  | Introduced on the C-Series and S-Series. |

**Usage Information** To disable MAC authentication bypass on a port, enter the `no dot1x mac-auth-bypass` command.

## dot1x max-eap-req

Configure the maximum number of times an extensive authentication protocol (EAP) request is transmitted before the session times out.

**Syntax** `dot1x max-eap-req number`  
To return to the default, use the `no dot1x max-eap-req` command.

**Parameters** *number* Enter the number of times an EAP request is transmitted before a session time-out. The range is from 1 to 10. The default is **2**.

**Defaults** **2**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description                              |
|----------|------------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

**Related Commands** [interface range](#) — configures a range of interfaces.

## dot1x port-control

Enable port control on an interface.

**Syntax** `dot1x port-control {force-authorized | auto | force-unauthorized}`

**Parameters**

|                           |                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------|
| <b>force-authorized</b>   | Enter the keywords <code>force-authorized</code> to forcibly authorize a port.                |
| <b>auto</b>               | Enter the keyword <code>auto</code> to authorize a port based on the 802.1X operation result. |
| <b>force-unauthorized</b> | Enter the keywords <code>force-unauthorized</code> to forcibly de-authorize a port.           |

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

**Usage Information** The authenticator performs authentication only when `port-control` is set to `auto`.

## dot1x quiet-period

Set the number of seconds that the authenticator remains quiet after a failed authentication with a client.

**Syntax** `dot1x quiet-period seconds`  
To disable quiet time, use the `no dot1x quiet-time` command.

**Parameters** **seconds** Enter the number of seconds. The range is from 1 to 65535. The default is **30**.

**Defaults** **30 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

## dot1x reauthentication

Enable periodic re-authentication of the client.

**Syntax** `dot1x reauthentication [interval seconds]`  
To disable periodic re-authentication, use the `no dot1x reauthentication` command.

**Parameters** **interval seconds** (Optional) Enter the keyword `interval` then the interval time, in seconds, after which re-authentication is initiated. The range is from 1 to 31536000 (1 year). The default is **3600 (1 hour)**.

| <b>Defaults</b>         | <b>3600 seconds (1 hour)</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                                          |         |                             |

## dot1x server-timeout

Configure the amount of time after which exchanges with the server time-out.

**Syntax** `dot1x server-timeout seconds`  
 To return to the default, use the `no dot1x server-timeout` command.

**Parameters**

**seconds** Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is **30**.

**Defaults** **30 seconds**

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| 7.4.1.0  | Introduced on the E-Series.              |

## dot1x supplicant-timeout

Configure the amount of time after which exchanges with the supplicant time-out.

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>dot1x supplicant-timeout seconds</code><br>To return to the default, use the <code>no dot1x supplicant-timeout</code> command.                                                                                                                      |
| <b>Parameters</b>      | <b>seconds</b> Enter a time-out value in seconds. The range is from 1 to 300, where 300 is implementation dependant. The default is <b>30</b> .                                                                                                           |
| <b>Defaults</b>        | <b>30 seconds</b>                                                                                                                                                                                                                                         |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

## dot1x tx-period

Configure the intervals at which EAPOL PDUs are transmitted by the Authenticator PAE.

|                   |                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>dot1x tx-period seconds</code><br>To return to the default, use the <code>no dot1x tx-period</code> command.                                     |
| <b>Parameters</b> | <b>seconds</b> Enter the interval time, in seconds, that EAPOL PDUs are transmitted. The range is from 1 to 65535 (1 year). The default is <b>30</b> . |
| <b>Defaults</b>   | <b>30 seconds</b>                                                                                                                                      |

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |
| 7.4.1.0  | Introduced on the E-Series.              |

## show dot1x interface

Display the 802.1X information on an interface.

**Syntax** `show dot1x interface interface`

**Parameters**

***interface*** Enter one of the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

**Defaults** none

**Command Modes**

- EXEC
- EXEC privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the C-Series, S-Series, and E-Series.  |

## SSH Server and SCP Commands

Dell Networking OS supports secure shell (SSH) protocol versions 1.5 and 2.0. SSH is a protocol for secure remote login over an insecure network. SSH sessions are encrypted and use authentication.

The SSH server and client are enhanced to support the VRF awareness functionality. Using this capability, an SSH client or server can use a VRF instance name to look up the correct routing table and establish a connection.

### crypto key generate

Generate keys for the SSH server.

#### Syntax

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
crypto key generate {rsa | rsa1}
```

#### Parameters

##### rsa

Enter the keyword `rsa` then the key size to generate a SSHv2 RSA host keys. The range is from 1024 to 2048 if you did not enable FIPS mode; if you enabled FIPS mode, you can only generate a 2048-bit key. The default is **1024**.

**NOTE:** You must have a license to access the FIPS mode. For more information, contact your Dell Networking representative.

##### rsa1

Enter the keyword `rsa1` then the key size to generate a SSHv1 RSA host keys. The range is from 1024 to 2048. The default is **1024**.

**NOTE:** This option is not available in FIPS mode.

#### Defaults

Key size **1024**; if you enable FIPS mode, the key size is **2048**.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                               |
|-------------|-------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON.               |
| 9.0.2.0     | Introduced on the S6000.                  |
| 8.3.19.0    | Introduced on the S4820T.                 |
| 8.3.11.1    | Introduced on the Z9000.                  |
| 8.3.12.0    | Added support for FIPS mode on the S4810. |
| 8.3.7.0     | Introduced on the S4810.                  |
| 7.6.1.0     | Introduced on the S-Series.               |
| 7.5.1.0     | Introduced on the C-Series.               |
| pre-6.1.1.0 | Introduced on the E-Series.               |

**Usage Information**

The host keys are required for key-exchange by the SSH server. If the keys are not found when you enable the server (`ip ssh server enable`), the keys are automatically generated.

This command requires user interaction and generates a prompt prior to overwriting any existing host keys.

**NOTE:** Only a user with superuser permissions should generate host-keys.

**Example**

```
Dell(conf)#crypto key generate rsa
Enter key size <1024-2048>. Default<1024> :
Host key already exists. Overwrite (y/n)?y
Generating 1024-bit SSHv2 RSA key.
!!
!!
Dell(conf)#
Dell(conf)#crypto key generate rsa1
Enter key size <1024-2048>. Default<1024> :
Host key already exists. Overwrite (y/n)?y
Generating 1024-bit SSHv1 RSA key.
!!
!!
!!
Dell(conf)#
```

**Related Commands**

- [ip ssh server](#) — enables the SSH server.
- [show crypto](#) — displays the SSH host public keys.

## crypto key zeroize rsa

Removes the generated RSA host keys and zeroize the key storage location.

**Syntax** `crypto key zeroize rsa`

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.                        |
| 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL |

## debug ip ssh

Enables collecting SSH debug information.

**Syntax** `debug ip ssh {client | server}`  
To disable debugging, use the `no debug ip ssh {client | server}` command.

**Parameters**

|               |                                                                                             |
|---------------|---------------------------------------------------------------------------------------------|
| <b>client</b> | Enter the keyword <code>client</code> to enable collecting debug information on the client. |
| <b>server</b> | Enter the keyword <code>server</code> to enable collecting debug information on the server. |

**Defaults** Disabled on both client and server.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version     | Description                 |
|-------------|-----------------------------|
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information**

Debug information includes details for key-exchange, authentication, and established session for each connection.

## ip scp topdir

Identify a location for files used in secure copy transfer.

**Syntax**

`ip scp topdir directory`

To return to the default setting, use the `no ip scp topdir` command.

**Parameters**

***directory*** Enter a directory name.

**Defaults**

The internal flash (`flash:`) is the default directory.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

|                          |                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------|
| <b>Usage Information</b> | To configure the switch as an SCP server, use the <code>ip ssh server</code> command. |
| <b>Related Commands</b>  | <a href="#">ip ssh server</a> — enables the SSH and SCP server on the switch.         |

## ip ssh authentication-retries

Configure the maximum number of attempts that should be used to authenticate a user.

|                        |                                                                                                                                                                |                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ssh authentication-retries 1-10</code>                                                                                                                |                                                                                                                  |
| <b>Parameters</b>      | <b>1-10</b>                                                                                                                                                    | Enter the number of maximum retries to authenticate a user. The range is from 1 to 10. The default is <b>3</b> . |
| <b>Defaults</b>        | <b>3</b>                                                                                                                                                       |                                                                                                                  |

| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

|                          |                                                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | This command specifies the maximum number of attempts to authenticate a user on an SSH connection with the remote host for password authentication. SSH disconnects when the number of password failures exceeds authentication-retries. |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## ip ssh connection-rate-limit

Configure the maximum number of incoming SSH connections per minute.

|               |                                                |
|---------------|------------------------------------------------|
| <b>Syntax</b> | <code>ip ssh connection-rate-limit 1-10</code> |
|---------------|------------------------------------------------|

**Parameters**                      **1-10**                      Enter the number of maximum numbers of incoming SSH connections allowed per minute. The range is from 1 to 10 per minute. The default is **10 per minute**.

**Defaults**                      **10 per minute**

**Command Modes**                      CONFIGURATION

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

## ip ssh hostbased-authentication

Enable hostbased-authentication for the SSHv2 server.

**Syntax**                      `ip ssh hostbased-authentication enable`  
To disable hostbased-authentication for SSHv2 server, use the `no ip ssh hostbased-authentication enable` command.

**Parameters**                      **enable**                      Enter the keyword `enable` to enable hostbased-authentication for SSHv2 server.

**Defaults**                      Disabled.

**Command Modes**                      CONFIGURATION

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

### Usage Information

If you enable this command, clients can log in without a password prompt. This command provides two levels of authentication:

- rhost-authentication is done with the file specified in the `ip ssh rhostfile` command.
- checking client host-keys is done with the file specified in the `ip ssh pub-key-file` command.

**NOTE:** Administrators must specify the two files (`rhosts` and `pub-key-file`) to configure host-based authentication.

### Related Commands

[ip ssh pub-key-file](#) — public keys of trusted hosts from a file.

[ip ssh rhostsfile](#) — trusted hosts and users for rhost authentication.

## ip ssh key-size

Configure the size of the server-generated RSA SSHv1 key.

**Syntax** `ip ssh key-size 512-869`

**Parameters** `512-869` Enter the key-size number for the server-generated RSA SSHv1 key. The range is from 512 to 869. The default is **768**.

**Defaults** Key size **768**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information**

The server-generated key is used for SSHv1 key-exchange.

## ip ssh password-authentication

Enable password authentication for the SSH server.

**Syntax**

`ip ssh password-authentication enable`

To disable password-authentication, use the `no ip ssh password-authentication enable` command.

**Parameters**

**enable**

Enter the keyword `enable` to enable password-authentication for the SSH server.

**Defaults**

Enabled

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |

| Version     | Description                 |
|-------------|-----------------------------|
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information** With password authentication enabled, you can authenticate using the local, RADIUS, or TACACS+ password fallback order as configured.

## ip ssh pub-key-file

Specify the file used for host-based authentication.

**Syntax** `ip ssh pub-key-file {WORD}`

**Parameters** **WORD** Enter the file name for the host-based authentication.

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Usage Information** This command specifies the file used for the host-based authentication. The `creates/` file overwrites the `flash://ADMIN_DIR/ssh/knownhosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

The file contains the OpenSSH-compatible public keys of the host for which host-based authentication is allowed. An example known host file format:

```
poclab4,123.12.1.123 ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAox/
QQp8xYhzOxn07yh4VGPaoUfgKoiETHO9G4sNV+ui
```

```
+DWEc3cgYAcU5Lai1MU2ODrzhCwyDNp05tKBU3t
ReG1o8AxLi6+S4hyEMqHzkzBFNVqHzpQc
+Rs4p2urzV0F4pRKnaXdHf3Lk4D460HZRhhVrxqeNxPDpEn WIMPJi0ds=
ashwani@poclab4
```

**NOTE:** For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the chassis.

#### Example

```
Dell#conf
Dell(conf)# ip ssh pub-key-file flash://knownhosts
Dell(conf)#
```

#### Related Commands

[show ip ssh client-pub-keys](#) — displays the client-public keys used for the host-based authentication.

## ip ssh rekey

Configures the time `rekey-interval` or volume `rekey-limit` threshold at which to re-generate the SSH key during an SSH session.

#### Syntax

```
ip ssh rekey [time rekey-interval] [volume rekey-limit]
To reset to the default, use no ip ssh rekey [time rekey-interval]
[volume rekey-limit] command.
```

#### Parameters

|                                  |                                                                                                                                                         |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>time <i>minutes</i></b>       | Enter the keywords <code>time</code> then the amount of time in minutes. The range is from 10 to 1440 minutes. The default is <b>60</b> minutes         |
| <b>volume <i>rekey-limit</i></b> | Enter the keywords <b>volume</b> then the amount of volume in megabytes. The range is from 1 to 4096 to megabytes. The default is <b>1024 megabytes</b> |

#### Defaults

The default time is **60** minutes. The default volume is **1024** megabytes.

#### Command Modes

CONFIGURATION mode

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.                        |
| 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL |

## ip ssh rhostsfile

Specify the rhost file used for host-based authorization.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>ip ssh rhostsfile {WORD}</code>                                                                                                                          |
| <b>Parameters</b>      | <b>WORD</b> Enter the rhost file name for the host-based authentication.                                                                                       |
| <b>Defaults</b>        | none                                                                                                                                                           |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

**Example**

```
Dell#conf
Dell(conf)# ip ssh rhostsfile flash://shosts
Dell(conf)#
```

**Usage Information**

This command specifies the rhost file used for host-based authentication. This `creates/` file overwrites the `flash:/ADMIN_DIR/ssh/shosts` file and deletes the user-specified file. Even though this command is a global configuration command, it does not appear in the running configuration because you only need to run this command once.

This file contains hostnames and usernames, for which hosts and users, rhost-authentication can be allowed.

**NOTE:** For `rhostfile` and `pub-key-file`, the administrator must FTP the file to the switch.

## ip ssh rsa-authentication (Config)

Enable RSA authentication for the SSHv2 server.

| <b>Syntax</b>            | <code>ip ssh rsa-authentication enable</code><br>To disable RSA authentication, use the <code>no ip ssh rsa-authentication enable</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |

| 8.3.11.1                 | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |
| 8.3.7.0                  | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |
| 7.6.1.0                  | Introduced on the S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |
| 7.5.1.0                  | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |
| pre-6.1.1.0              | Introduced on the E-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |
| <b>Usage Information</b> | Enabling RSA authentication allows the user to log in without being prompted for a password. In addition, the OpenSSH compatible SSHv2 RSA public key must be added to the list of authorized keys ( <code>ip ssh rsa-authentication my-authorized-keys device://filename</code> command).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |               |                                                                                          |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |             |                             |

## ip ssh vrf

Specify a VRF for an outgoing SSH connections.

**Syntax** `ip ssh vrf vrf-name`

To delete a VRF for an outgoing SSH connection, use the `no ip ssh vrf vrf-name` command.

#### Parameters

**vrf vrf-name** Enter the keyword `vrf` and then the name of the VRF to configure that VRF for an outgoing SSH session.

#### Defaults

Not configured.

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.5(0.0) | Introduced on the Z9500.              |
| 9.4(0.0) | Introduced on the S-Series and Z9000. |

#### Usage Information

If you configure a VRF for an SSH session, then you need not explicitly mention the same VRF for the SSH client sessions intended for that VRF. The `vrf` attribute in the `ip ssh vrf` command is applicable for both the SSH client as well as the COPY (SCP) commands.

#### Example

```
Dell(conf)#ip ssh vrf vrf1
Dell(conf)#do ssh 10.10.10.2 -l admin
Dell(conf)#no ip ssh vrf vrf1
```

## ip ssh source-interface

Specifies an interface's IP address as the source IP address for an outgoing SSH connections.

#### Syntax

```
ip ssh source-interface interface
```

To delete a source interface, use the `no ip ssh source-interface` command.

#### Parameters

**interface** Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.

- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.5(0.0) | Introduced on the Z9500.              |
| 9.4(0.0) | Introduced on the S-Series and Z9000. |

**Usage Information** The `source-interface interface` attribute is applicable for both the `SSH client` as well as the `COPY (SCP)` commands. Using these attributes the client session tags an error to the user during run time, in case there is a mismatch between this command and the `ip ssh vrf` command.

**Example**

```
Dell(conf)#ip ssh source-interface tengigabitethernet 1/42
Dell(conf)#do ssh 10.10.10.2 -l admin
Dell(conf)#no ip ssh source-interface
```

## ip ssh server

Configure an SSH server. SSH server is enabled by default.

### S4820T

#### Syntax

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
ip ssh server {ciphers cipher-list} {enable | port port-number}
[kex key-exchange-algorithm] [mac hmac-algorithm] [version {1 | 2}]
```

To disable SSH server functions, use the `no ip ssh server {ciphers cipher-list} {enable | port port-number} [kex key-exchange-algorithm] [mac hmac-algorithm] [version {1 | 2}]` command.

## Parameters

### **enable**

Enter the key word `enable` to start the SSH server.

### **ciphers *cipher-list***

Enter the keyword `ciphers` and then a space-delimited list of ciphers that the SSH server supports.

The following ciphers are available.

- `3des-cbc`
- `aes128-cbc`
- `aes192-cbc`
- `aes256-cbc`
- `aes128-ctr`
- `aes192-ctr`
- `aes256-ctr`

The default cipher list is used.

- `3des-cbc`
- `aes128-cbc`
- `aes192-cbc`
- `aes256-cbc`
- `aes128-ctr`
- `aes192-ctr`
- `aes256-ctr`

### **mac *hmac-algorithm***

Enter the keyword `mac` then a space-delimited list of hash message authentication code (HMAC) algorithms supported by the SSH server for keying hashing for the message authentication.

The following HMAC algorithms are available:

- `hmac-sha1`
- `hmac-sha1-96`
- `hmac-sha2-256`
- `hmac-sha2-256-96`

When FIPS is enabled, the default HMAC algorithm is `hmac-sha1-96`.

When FIPS is not enabled, the default HMAC algorithms are the following:

- `hmac-md5`
- `hmac-md5-96`

- `hmac-sha1`
- `hmac-sha1-96`
- `hmac-sha2-256`
- `hmac-sha2-256-96`

***kex key-exchange-algorithm***

Enter the keyword `kex` and then a space-delimited list of key exchange algorithms supported by the SSH server.

The following key exchange algorithms are available:

- `diffie-hellman-group-exchange-sha1`
- `diffie-hellman-group1-sha1`
- `diffie-hellman-group14-sha1`

When FIPS is enabled, the default key-exchange-algorithm is `diffie-hellman-group14-sha1`.

When FIPS is not enabled, the default key-exchange-algorithms are the following:

- `diffie-hellman-group-exchange-sha1`
- `diffie-hellman-group1-sha1`,
- `diffie-hellman-group14-sha1`

***port port-number***

(OPTIONAL) Enter the keyword `port` then the port number of the listening port of the SSH server. The range is from 1 to 65535. The default is **22**.

**[version {1 | 2}]**

(OPTIONAL) Enter the keyword `version` then the SSH version 1 or 2 to specify only SSHv1 or SSHv2.

**NOTE:** If you enable FIPS mode, you can only select version 2.

**Defaults**

- Default listening port is **22**.
- Default cipher list is `3des-cbc,aes128-cbc,aes192-cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr`.
- When FIPS is enabled, the default is `hmac-sha1-96`.
- When FIPS is not enabled, the default is `hmac-md5,hmac-md5-96,hmac-sha1,hmac-sha1-96,hmac-sha2-256,hmac-sha2-256-96`.
- *When FIPS is enabled, the default is `diffie-hellman-group14-sha1`.*
- When FIPS is not enabled, the default is `diffie-hellman-group-exchange-sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1`.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                                                                                                     |
| 9.5(0.0)    | Introduced the <code>cipher</code> , <code>key</code> and <code>mac</code> options on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.0.2.0     | Introduced on the S6000.                                                                                                        |
| 8.3.19.0    | Introduced on the S4820T.                                                                                                       |
| 8.3.11.1    | Introduced on the Z9000.                                                                                                        |
| 8.3.7.0     | Introduced on the S4810.                                                                                                        |
| 7.6.1.0     | Introduced on the S-Series.                                                                                                     |
| 7.5.1.0     | Introduced on the C-Series.                                                                                                     |
| pre-6.1.1.0 | Introduced on the E-Series.                                                                                                     |

**Usage Information** This command enables the SSH server and begins listening on a port. If a port is not specified, listening is on SSH default port 22.

**NOTE:** Starting with Dell Networking OS Release 9.2(0.0), SSH server is enabled by default.

#### Example

```
Dell# conf
Dell(conf)# ip ssh server port 45
Dell(conf)# ip ssh server enable
Dell#
```

#### Related Commands

[show ip ssh](#) — displays the ssh information.

## ip ssh server vrf

Configure an SSH server on either a specific VRF or a management VRF.

#### Syntax

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
ip ssh server vrf {management | vrf-name}
```

To disable the SSH server configuration, use the `no ip ssh server vrf {management | vrf-name}` command.

## Parameters

|                       |                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrf management</b> | Enter the key word <code>vrf</code> followed by the keyword <code>management</code> to configure an SSH server on a management VRF. |
| <b>vrf vrf-name</b>   | Enter the key word <code>vrf</code> followed by the VRF name to configure an SSH server on that VRF.                                |

## Defaults

None

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.5(0.0) | Introduced on the Z9500.              |
| 9.4(0.0) | Introduced on the S-Series and Z9000. |

## Usage Information

You can enable the SSH server on either a management VRF or a user defined VRF but not both. If no VRF is specified, then the SSH server is enabled on the default VRF.

If the SSH server is enabled on a VRF with name `vrf1`, then use the following command to restart the SSH server on a VRF with name `vrf2`: `ip ssh server vrf vrf2`. If the SSH server is enabled on a VRF with name `vrf1`, then use the following command to restart the SSH server on the default VRF: `ip ssh server vrf`.

## Example

- `Dell(conf)#ip ssh server vrf vrf1`
- `Dell(conf)#no ip ssh server vrf`
- `Dell(conf)#ip ssh server vrf management`
- `Dell(conf)#no ip ssh server vrf`

## Related Commands

[show ip ssh](#) — displays the ssh information.

## show crypto

Display the public part of the SSH host-keys.

### Syntax

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
show crypto key mypubkey {rsa | rsal}
```

## Parameters

|                 |                                                                               |
|-----------------|-------------------------------------------------------------------------------|
| <b>Key</b>      | Enter the keyword <code>key</code> to display the host public key.            |
| <b>mypubkey</b> | Enter the keyword <code>mypubkey</code> to display the host public key.       |
| <b>rsa</b>      | Enter the keyword <code>rsa</code> to display the host SSHv2 RSA public key.  |
| <b>rsa1</b>     | Enter the keyword <code>rsa1</code> to display the host SSHv1 RSA public key. |

**NOTE:** If you enable FIPS mode, this parameter is not available.

## Defaults

none

## Command Modes

EXEC

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version            | Description                 |
|--------------------|-----------------------------|
| <b>9.7(0.0)</b>    | Introduced on the S6000–ON. |
| <b>9.0.2.0</b>     | Introduced on the S6000.    |
| <b>8.3.11.1</b>    | Introduced on the Z9000.    |
| <b>8.3.7.0</b>     | Introduced on the S4810.    |
| <b>7.6.1.0</b>     | Introduced on the S-Series. |
| <b>7.5.1.0</b>     | Introduced on the C-Series. |
| <b>pre-6.1.1.0</b> | Introduced on the E-Series. |

## Usage Information

This command is useful if the remote SSH client implements Strict Host Key Checking. You can copy the host key to your list of known hosts.

## Example

```
Dell#show crypto key mypubkey rsa1
1024 65537
150477578329696762034442036788963493870885070479991994815292070

Modes

- EXEC
- EXEC Privilege

Command  
History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |
| 8.3.7.0     | Introduced on the S4810.    |
| 7.6.1.0     | Introduced on the S-Series. |
| 7.5.1.0     | Introduced on the C-Series. |
| pre-6.1.1.0 | Introduced on the E-Series. |

Example

```
Dell#show ip ssh
SSH server           : enabled.
SSH server version   : v1 and v2.
SSH server vrf       : default.
SSH server ciphers   : 3des-cbc,aes128-cbc,aes192-
cbc,aes256-cbc,aes128-ctr,aes192-ctr,aes256-ctr.
SSH server macs      : hmac-md5,hmac-md5-96,hmac-
sha1,hmac-sha1-96,hmac-sha2-256,hmac-sha2-256-96.
SSH server kex algorithms : diffie-hellman-group-exchange-
sha1,diffie-hellman-group1-sha1,diffie-hellman-group14-sha1.
Password Authentication : enabled.
Hostbased Authentication : disabled.
RSA Authentication    : disabled.
  Vty      Encryption      HMAC      Remote IP
  2        aes128-cbc      hmac-md5    10.16.127.141
  4        aes128-cbc      hmac-md5    10.16.127.141
* 5        aes128-cbc      hmac-md5    10.16.127.141
Dell#
```

**Related  
Commands**

[ip ssh server](#) — configures an SSH server.

[show ip ssh client-pub-keys](#) — displays the client-public keys.

## show ip ssh client-pub-keys

Display the client public keys used in host-based authentication.

**Syntax** `show ip ssh client-pub-keys`

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                 |
|-------------|-----------------------------|
| 9.7(0.0)    | Introduced on the S6000-ON. |
| 9.0.2.0     | Introduced on the S6000.    |
| 8.3.19.0    | Introduced on the S4820T.   |
| 8.3.11.1    | Introduced on the Z9000.    |

freedom@poclalab4
```

Dell#

## Related Commands

[ip ssh rsa-authentication \(Config\)](#) – configures the RSA authorized keys.

## ssh

Open an SSH connection specifying the hostname, username, encryption cipher, HMAC algorithm, port number, and version of the SSH client.

### Syntax

**NOTE:** Some of the parameters in this command require licensing to access. For more information, contact your Dell Networking representative.

```
ssh [vrf vrf-name] {hostname | ipv4 address | ipv6 address} [-c encryption cipher | -l username | -m HMAC algorithm | -p port-number | -v {1 | 2}]
```

### Parameters

***vrf vrf-name***

(OPTIONAL) Enter the keyword `vrf` and then the name of the VRF to specify the VRF used with the SSH session.

**NOTE:** The VRF configured using this command has a higher precedence than the VRF configured using the `ip ssh vrf vrf-name` command. If you do not configure a VRF using this command, then the SSH client uses the configured VRF (if any). If there is a mismatch between VRFs that are configured using the `ip ssh source-interface` command and the `ssh vrf vrf-name` command, then an error is reported.

***hostname***

(OPTIONAL) Enter the IP address or the host name of the remote device.

***vrf instance***

(OPTIONAL) E-Series Only: Enter the keyword `vrf` then the VRF Instance name to open an SSH connection to that instance.

***ipv4 address***

(OPTIONAL) Enter the IP address in dotted decimal format A.B.C.D.

***ipv6-address prefix-length***

(OPTIONAL) Enter the IPv6 address in the `x:x:x:x` format then the prefix length in the `/x` format. The range is from `/0` to `/128`.

**NOTE:** The `::` notation specifies successive hexadecimal fields of zeros.

***-c encryption cipher***

Enable the "FIPS mode enable", this mode will support only v2 client.

"no fips mode enable"(disable) will support v1 & v2 client.  
This comment is applicable for both ciphers & HMAC algorithms:

- `3des-cbc`: Force ssh to use 3des-cbc encryption cipher.
- `aes128-cbc` : Force ssh to use aes128-cbc encryption cipher
- `aes192-cbc` : Force ssh to use aes192-cbc encryption cipher
- `aes256-cbc` : Force ssh to use aes256-cbc encryption cipher
- `aes128-ctr` : Force ssh to use aes128-ctr encryption cipher
- `aes192-ctr` : Force ssh to use aes192-ctr encryption cipher
- `aes256-ctr` : Force ssh to use aes256-ctr encryption cipher

**-l *username*** (OPTIONAL) Enter the keyword `-l` then the user name used in this SSH session. The default is the user name of the user associated with the terminal.

**-m *HMAC algorithm*** Enter one of the following HMAC algorithms to use. (For v2 clients only):

"no fips mode enable"(disable) will support v1 & v2 client.

- `hmac-md5`: Force ssh to use hmac-md5 HMAC algorithm.
- `hmac-md5-96`: Force ssh to use hmac-md5-96 HMAC algorithm.
- `hmac-sha1`: Force ssh to use hmac-sha1 HMAC algorithm.
- `hmac-sha1-96` : Force ssh to use hmac-sha1-96 HMAC algorithm.
- `hmac-sha2-256` : Force ssh to use hmac-sha2-256 HMAC algorithm.
- `hmac-sha2-256-96`: Force ssh to use hmac-sha2-256-96 HMAC algorithm.

**-p *port-number*** (OPTIONAL) Enter the keyword `-p` then the port number. The range is from 1 to 65535. The default is **22**.

**-v {1 | 2}** (OPTIONAL) Enter the keyword `-v` then the SSH version 1 or 2. The default is the version from the protocol negotiation.

**Defaults** As shown in the *Parameters* section.

**Command Modes** EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version     | Description                                                                        |
|-------------|------------------------------------------------------------------------------------|
| 9.7(0.0)    | Introduced on the S6000–ON.                                                        |
| 9.4(0.0)    | Added support for VRF.                                                             |
| 9.0.2.0     | Introduced on the S6000.                                                           |
| 8.3.19.0    | Introduced on the S4820T.                                                          |
| 8.3.11.1    | Introduced on the Z9000.                                                           |
| 8.3.12.0    | Added support for the <code>-c</code> and <code>-m</code> parameters on the S4810. |
| 8.3.7.0     | Introduced on the S4810.                                                           |
| 7.6.1.0     | Introduced on the S-Series.                                                        |
| 7.5.1.0     | Added IPv6 support. Introduced on the C-Series.                                    |
| pre-6.1.1.0 | Introduced on the E-Series.                                                        |

## Usage Information

Dell Networking OS supports both inbound and outbound SSH sessions using IPv4 or IPv6 addressing. Inbound SSH supports accessing the system through the management interface as well as through a physical Layer 3 interface.

## Example

```
Dell#ssh 10.16.151.48 -l anvltest

Trying 10.16.151.48...
01:18:16: %STKUNIT0-M:CP %SEC-5-SSH_USAGE: Initiated SSH
Client v2 (FIPS Disabled) to anvltest@10.16.151.48 by default
from console
anvltest@10.16.151.48's password:
Last login: Thu Jan  5 00:17:47 2012 from login-maa-101
[anvltest@dt-maa-linux-1 ~]# exit
logout
Dell#

Dell#ssh vrf vrf1 10.10.10.2 -l admin
```

## Secure DHCP Commands

DHCP as defined by RFC 2131 provides no authentication or security mechanisms. Secure DHCP is a suite of features that protects networks that use dynamic address allocation from spoofing and attacks.

## clear ip dhcp snooping

Clear the DHCP binding table.

**Syntax** `clear ip dhcp snooping binding`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

**Related Commands** [show ip dhcp snooping](#) — displays the contents of the DHCP binding table.

## ip dhcp relay

Enable Option 82.

**Syntax** `ip dhcp relay information-option [trust-downstream | vrf]`

**Parameters**

|                         |                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>trust-downstream</b> | Configure the system to trust Option 82 when it is received from the previous-hop router.                                                                                                                                         |
| <b>vrf</b>              | Enter the keyword <code>vrf</code> to include VRF related information in the Option 82. This configuration enables the relay agent to include VRF related information when it forwards the broadcasts from client to DHCP server. |

**Defaults** Disabled.

**Command Modes** CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.4(0.0) | Added support for VRF.                   |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## ip dhcp snooping

Enable DHCP Snooping globally.

**Syntax** [no] ip dhcp snooping

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## Usage Information

When enabled, no learning takes place until you enable snooping on a VLAN. After disabling DHCP Snooping, the binding table is deleted and Option 82, IP Source Guard, and Dynamic ARP Inspection are disabled.

Related  
Commands

[ip dhcp snooping vlan](#) — enables DHCP Snooping on one or more VLANs.

## ip dhcp snooping binding

Create a static entry in the DHCP binding table.

**Syntax** `[no] ip dhcp snooping binding mac address vlan-id vlan-id ip ip-address interface type slot/port lease number`

**Parameters**

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mac address</b>     | Enter the keyword <code>mac</code> then the MAC address of the host to which the server is leasing the IP address.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>vlan-id vlan-id</b> | Enter the keywords <code>vlan-id</code> then the VLAN to which the host belongs. The range is from 2 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ip ip-address</b>   | Enter the keyword <code>ip</code> then the IP address that the server is leasing.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>interface type</b>  | Enter the keyword <code>interface</code> then the type of interface to which the host is connected. <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li></ul> |
| <b>slot/port</b>       | Enter the slot and port number of the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>lease time</b>      | Enter the keyword <code>lease</code> then the amount of time the IP address is leased. The range is from 1 to 4294967295.                                                                                                                                                                                                                                                                                                                                                                                       |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.8.1.0  | Introduced on the C-Series and S-Series.             |

**Related Commands**      [show ip dhcp snooping](#) — displays the contents of the DHCP binding table.

## ip dhcp snooping database

Delay writing the binding table for a specified time.

**Syntax**                    `ip dhcp snooping database write-delay minutes`

**Parameters**              *minutes*                    The range is from 5 to 21600.

**Defaults**                    none

**Command Modes**            CONFIGURATION

**Command History**            This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.5(0.0) | Introduced on the Z9500.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## ip dhcp snooping database renew

Renew the binding table.

**Syntax**                    `ip dhcp snooping database renew`

**Defaults**                    none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## ip dhcp snooping trust

Configure an interface as trusted.

**Syntax** [no] ip dhcp snooping trust

**Defaults** Untrusted

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## ip dhcp source-address-validation

Enable IP source guard.

**Syntax** [no] ip dhcp source-address-validation

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000–ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

## ip dhcp snooping vlan

Enable DHCP Snooping on one or more VLANs.

**Syntax** [no] ip dhcp snooping vlan *name*

**Parameters** *name* Enter the name of a VLAN on which to enable DHCP Snooping.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000–ON. |

| Version  | Description                              |
|----------|------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.8.1.0  | Introduced on the C-Series and S-Series. |

#### Usage Information

When enabled, the system begins creating entries in the binding table for the specified VLANs.

**NOTE:** Learning only happens if there is a trusted port in the VLAN.

#### Related Commands

[ip dhcp snooping trust](#) — configures an interface as trusted.

## show ip dhcp snooping

Display the contents of the DHCP binding table.

**Syntax** `show ip dhcp snooping binding`

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

#### Command History

[clear ip dhcp snooping](#) — clears the contents of the DHCP binding table.

# Role-Based Access Control Commands

With Role-Based Access Control (RBAC), access and authorization is controlled based on a user's role. Users are granted permissions based on their user roles, not on their individual user ID. User roles are created for job functions and through those roles they acquire the permissions to perform their associated job function.

This section describes the syntax and usage of RBAC-specific commands. You can find information on other related security commands in this chapter:

- [aaa accounting](#)
- [aaa authentication login](#)
- [aaa authorization commands](#)
- [authorization](#)
- [show accounting](#)
- [show users](#)
- [username](#)

## aaa authorization role-only

Configure authentication to use the user's role only when determining if access to commands is permitted.

| <b>Syntax</b>                            | <code>aaa authorization role-only</code><br>To return to the default setting, use the <code>no aaa authentication role-only</code> command.                                                                                                                                                                                                                                                                                                    |                    |                                                                                                                                                             |                                          |                                                                                                                                                      |          |                                                         |

| 9.5(0.0)                                 | Introduced on the Z9000, S6000, S4820T, S4810, and MXL.                                                                                                                                                                                                                                                                                                                                                                                        |                    |                                                                                                                                                             |                                          |                                                                                                                                                      |          |                                                         |

## Usage Information

By default, access to commands are determined by the user's role (if defined) or by the user's privilege level. If the `aaa authorization role-only` command is enabled, then only the user's role is used.

Before you enable role-based only AAA authorization:

1. Locally define a system administrator user role. This will give you access to login with full permissions even if network connectivity to remote authentication servers is not available.
2. Configure login authentication on the console. This ensures that all users are properly identified through authentication no matter the access point
3. Specify an authentication method (RADIUS, TACACS+, or Local).
4. Specify authorization method (RADIUS, TACACS+ or Local).
5. Verify the configuration has been applied to the console or VTY line.

## Related Commands

login authentication, password, radius-server host, tacacs-server host

## role

Changes command permissions for roles.

**Syntax** `role mode {{{ addrole | deleterole } role-name } | reset } command`  
To delete access to a command, use the `no role mode role-name`

## Parameters

|                   |                                                                                                                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mode</b>       | Enter one of the following keywords as the mode for which you are controlling access:<br><br>configure for CONFIGURATION mode<br><br>exec for EXEC mode<br><br>interface for INTERFACE modes<br><br>line for LINE mode<br><br>route-map for Route-map mode<br><br>router for Router mode |
| <b>addrole</b>    | Enter the keyword <code>addrole</code> to add permission to the command. You cannot add or delete rights for the <code>sysadmin</code> role.                                                                                                                                             |
| <b>deleterole</b> | Enter the keyword <code>deleterole</code> to remove access to the command. You cannot add or delete rights for the <code>sysadmin</code> role.                                                                                                                                           |

|                         |                         |                                                                                                                                                              |
|-------------------------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | <b><i>role-name</i></b> | Enter a text string for the name of the user role up to 63 characters. These are 3 system defined roles you can modify: secadmin, netadmin, and netoperator. |
|                         | <b>reset</b>            | Enter the keyword <code>reset</code> to reset all roles back to default for that command.                                                                    |
|                         | <b>command</b>          | Enter the command's keywords to assign the command to a certain access level. You can enter one or more keywords.                                            |
| <b>Defaults</b>         | none                    |                                                                                                                                                              |

## show role

Display information on permissions assigned to a command, including user role and/or permission level.

|                      |                                              |                                                                                                                                                                                                          |
|----------------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <code>show role mode {mode} {command}</code> |                                                                                                                                                                                                          |
| <b>Parameters</b>    | <b><i>command</i></b>                        | Enter the command's keywords to assign the command to a certain access level. You can enter one or all of the keywords.                                                                                  |
|                      | <b><i>mode mode</i></b>                      | Enter keyword then one of the following modes. <ul style="list-style-type: none"> <li>• configure</li> <li>• exec</li> <li>• interface</li> <li>• line</li> <li>• route-map</li> <li>• router</li> </ul> |
| <b>Defaults</b>      | none                                         |                                                                                                                                                                                                          |
| <b>Command Modes</b> | EXEC Privilege                               |                                                                                                                                                                                                          |

| Command History | Version  | Description                                        |
|-----------------|----------|----------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                        |
|                 | 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL |

**Examples**

```
Dell#show role mode configure username
Role access: sysadmin

Dell#show role mode configure management route
Role access: netadmin, sysadmin

Dell#show role mode configure management crypto-policy
Role access: secadmin, sysadmin
```

**Related Commands** [userrole](#), username, privilege

## show userroles

Display information on all defined user roles.

**Syntax** `show userroles`

**Example**

```
Dell#show userroles
Role           Inheritance  Modes
netoperator
netadmin       Exec
               Exec Config Interface Line Router IP
               Route-map Protocol MAC
secadmin       Exec Config
sysadmin       Exec Config Interface Line Router IP
               Route-map Protocol MAC
netoperator
testadmin      netadmin    Exec Config Interface Line Router IP
               Route-map Protocol MAC
```

**Command Modes** EXEC Privilege

| Command History | Version  | Description                                         |
|-----------------|----------|-----------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                         |
|                 | 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL. |

**Related Commands** [userrole](#), username

## userrole

Create user roles for the role-based security model.

**Syntax** `userrole name inherit existing-role-name`

To delete a role name, use the `no userrole name` command. Note that the reserved role names may not be deleted.

#### Parameters

|                                          |                                                                                                                                                             |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>name</i></b>                       | Enter a text string for the name of the user up to 63 characters. It cannot be one of the system defined roles (sysadmin, secadmin, netadmin, netoperator). |
| <b><i>inherit existing-role-name</i></b> | Enter the <code>inherit</code> keyword then specify the system defined role to inherit permissions from (sysadmin, secadmin, netadmin, netoperator).        |

#### Defaults

none

CONFIGURATION

#### Command History

| Version  | Description                                         |
|----------|-----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                         |
| 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, MXL. |

#### Usage Information

Instead of using the system defined user roles, you can create a new user role that best matches your organization. When you create a new user role, you first inherit permissions from one of the system defined roles. Otherwise you would have to create a user role from scratch. You then restrict commands or add commands to that role. For information about this topic, See *Modifying Command Permissions for Roles*.

**NOTE:** You can change user role permissions on system pre-defined user roles or user-defined user roles.

#### Important Points to Remember

Consider the following when creating a user role:

- Only the system administrator and user-defined roles inherited from the system administrator can create roles and usernames. Only the system administrator, security administrator, and roles inherited from these can use the `role` command to modify command permissions. The security administrator and roles inherited by security administrator can only modify permissions for commands they already have access to.
- Make sure you select the correct role you want to inherit.

**NOTE:** If you inherit a user role, you cannot modify or delete the inheritance. If you want to change or remove the inheritance, delete the user role and create it again. If the user role is in use, you cannot delete the user role.

#### Related Commands

**role mode** { { **addrole** | **deleterole** } *role-name* } | **reset** } *command* – Modifies (adds or deletes) command permissions for newly created user roles and system defined roles.

# Service Provider Bridging

Service provider bridging is composed of virtual local area network (VLAN) Stacking, Layer 2 Protocol Tunneling, and Provider Backbone Bridging as described in the *Dell Networking OS Configuration Guide Service Provider Bridging* chapter.

This chapter includes command line information (CLI) for the Dell Networking operating software Layer 2 Protocol Tunneling (L2PT). L2PT enables protocols to tunnel through an 802.1q tunnel.

Dell Networking OS supports L2PT on Dell Networking OS.

For more information, refer to [VLAN Stacking](#), [Spanning Tree Protocol \(STP\)](#), and [GARP VLAN Registration \(GVRP\)](#).

## Important Points to Remember

- L2PT is enabled at the interface VLAN-Stack VLAN level. For more information about Stackable VLAN (VLAN-Stacking) commands, refer to [VLAN Stacking](#).
- The default behavior is to disable protocol packet tunneling through the 802.1q tunnel.
- Rate-limiting is required to protect against bridge protocol data units (BPDU) attacks.
- A port channel (including through link aggregation control protocol [LACP]) can be configured as a VLAN-Stack access or trunk port.
- Address resolution protocol (ARP) packets work as expected across the tunnel.
- Far-end failure detection (FEFD) works the same as with Layer 2 links.
- Protocols that use Multicast MAC addresses (for example, open shortest path first [OSPF]) work as expected and carry over to the other end of the VLAN-Stack VLAN.

## debug protocol-tunnel

Enable debugging to ensure incoming packets are received and rewritten to a new MAC address.

**Syntax**                    `debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]`  
To disable debugging, use the `no debug protocol-tunnel interface {in | out | both} [vlan vlan-id] [count value]` command.

## Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>interface</b>           | Enter one of the following interfaces and slot/port information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>• For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li><li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li></ul> |
| <b>in   out   both</b>     | Enter the keyword <code>in</code> , <code>out</code> , or <code>both</code> to debug incoming interfaces, outgoing interfaces, or both incoming and outgoing interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>vlan <i>vlan-id</i></b> | Enter the keyword <code>vlan</code> then the VLAN ID. The range is from 1 to 4094.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>count <i>value</i></b>  | Enter the keyword <code>count</code> then the number of debug outputs. The range is from 1 to 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Defaults

Debug disabled.

## Command Modes

EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                  |
|----------|--------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                  |
| 9.0.2.0  | Introduced on the S6000.                                     |
| 8.3.19.0 | Introduced on the S4820T.                                    |
| 8.3.11.1 | Introduced on the Z9000.                                     |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.         |
| 8.3.7.0  | Introduced on the S4810.                                     |
| 8.2.1.0  | Introduced on the C-Series, E-Series, and E-Series ExaScale. |
| 7.4.1.0  | Introduced                                                   |

# protocol-tunnel

Enable protocol tunneling on a stacked (Q-in-Q) VLAN for specified protocol packets.

**Syntax** `protocol-tunnel {rate-limit rate | stp}`  
To disable protocol tunneling for a Layer 2 protocol, use the `no protocol-tunnel` command.

**Parameters**

|                               |                                                                                                                                                  |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rate-limit <i>rate</i></b> | Enter the keyword <code>rate-limit</code> followed by a number for the rate-limit for tunneled packets on the VMAN. The range is from 64 to 320. |
| <b>stp</b>                    | Enter the keyword <code>stp</code> to enable protocol tunneling on a spanning tree, including STP, MSTP, RSTP, and PVST.                         |

**Defaults** none

**Command Modes** CONF-IF-VLAN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guid*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                                     |
| 9.0.2.0  | Introduced on the S6000.                                                                                                        |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                        |
| 8.5.1.1  | Added support for 802.1X, E-LMI, GMRP, GVRP, LLDP, LACP, MMRP, MVRP, and OAM 802.3ah protocol traffic to the E-Series ExaScale. |
| 8.2.1.0  | Introduced on the C-Series, E-Series, and E-Series ExaScale.                                                                    |
| 7.4.1.0  | Introduced                                                                                                                      |

**Example**

```
Dell#conf
Dell(conf)#interface vlan 2
Dell(conf-if-vl-2)#vlan-stack compatible
Dell(conf-if-vl-2)#member Te 1/2-3
Dell(conf-if-vl-2)#protocol-tunnel stp
Dell(conf-if-vl-2)#protocol-tunnel enable
```

**Related Command** [show protocol-tunnel](#) — displays tunneling information for all VLANs.

## protocol-tunnel destination-mac

Overwrite the BPDU destination MAC address with a specific value.

|                   |                                                                  |                                                                            |
|-------------------|------------------------------------------------------------------|----------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>protocol-tunnel destination-mac <i>xstp</i> address</code> |                                                                            |
| <b>Parameters</b> | <b>stp</b>                                                       | Change the default destination MAC address used for L2PT to another value. |

**Defaults** The default destination MAC is 01:01:e8:00:00:00.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.               |
| 9.0.2.0  | Introduced on the S6000.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.7.0  | Introduced on the S4810.                  |
| 8.2.1.0  | Introduced on the C-Series, and S-Series. |
| 7.4.1.0  | Introduced                                |

**Usage Information** When you enable VLAN-Stacking, no protocol packets are tunneled.

**Related Command** [show protocol-tunnel](#) — displays tunneling information for all VLANs.

## protocol-tunnel enable

Enable protocol tunneling globally on the system.

**Syntax** `protocol-tunnel enable`  
To disable protocol tunneling, use the `no protocol-tunnel enable` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.4.1.0  | Introduced                  |

**Usage Information** Dell Networking OS must have the default CAM profile with the default microcode before you enable L2PT.

## protocol-tunnel rate-limit

Enable traffic rate limiting per box.

**Syntax** `protocol-tunnel rate-limit rate`  
To reset the rate limit to the default, use the `no protocol-tunnel rate-limit rate` command.

**Parameters** **rate** Enter the rate in frames per second. The range is from 75 to 3000. The default is **75**.

**Defaults** **75** frames per second.

**Command Modes** CONF-IF-VLAN-STACK

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                                                                                                                      |
|----------|----------------------------------------------------------------------------------------------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                                                                                                         |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                        |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                         |
| 8.3.7.0  | Introduced on the S4810.                                                                                                         |
| 8.2.1.0  | Introduced on the C-Series, E-Series TeraScale, and E-Series ExaScale. Maximum rate limit on E-Series reduced from 4000 to 3000. |
| 7.4.1.0  | Introduced                                                                                                                       |

#### Example

```
Dell(conf-if-vl-2)#vlan-stack compatible
Dell(conf-if-vl-2-stack)#protocol-tunnle rate-limit 100
<<<<<<<< VLAN stack mode
Dell(conf-if-vl-2-stack)#show config
!
interface Vlan 2
 no ip address
  mtu 1000
  vlan-stack compatible
  protocol-tunnel rate-limit 100
 shutdown
```

#### Related Commands

[show protocol-tunnel](#) — displays tunneling information for all VLANs.

[show running-config](#) — displays the current configuration.

## show protocol-tunnel

Display protocol tunnel information for all or a specified VLAN-Stack VLAN.

**Syntax** `show protocol-tunnel [vlan vlan-id]`

**Parameters**

`vlan vlan-id` (OPTIONAL) Enter the keyword `vlan` then the VLAN ID to display information for the one VLAN. The range is from 1 to 4094.

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                 |
|----------|-------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                 |
| 9.0.2.0  | Introduced on the S6000.                                    |
| 8.3.19.0 | Introduced on the S4820T.                                   |
| 8.3.11.1 | Introduced on the Z9000.                                    |
| 8.3.7.0  | Introduced on the S4810.                                    |
| 8.2.1.0  | Introduced on the C-Series, E-Series and E-Series ExaScale. |
| 7.4.1.0  | Introduced                                                  |

**Example**

```
Dell#show protocol-tunnel
System Rate-Limit: 75 frames/second
VLAN  Protocols  Interface
1000  STP, PVST    Te 5/7, Te 5/6
1001  LLDP, GVRP   Te 5/7, Te 5/6
1002  MMRP, MVRP  Te 5/7, Te 5/6
1003  LACP, DOT1X Te 5/7, Te 5/6

## sFlow

The Dell Networking operating software (OS) supports sFlow commands on Dell Networking OS. Dell Networking operating software sFlow monitoring system includes an sFlow Agent and an sFlow Collector.

- The sFlow Agent combines the flow samples and interface counters into sFlow datagrams and forwards them to the sFlow Collector.
- The sFlow Collector analyses the sFlow Datagrams received from the different devices and produces a network-wide view of traffic flows.

### Important Points to Remember

- Dell Networking recommends that the sFlow Collector be connected to the Dell Networking chassis through a line card port rather than the route processor module (RPM) Management Ethernet port.
- Dell Networking operating software exports all sFlow packets to the sFlow Collector. A small sampling rate can equate to many exported packets. A backoff mechanism is automatically applied to reduce this amount. Some sampled packets may be dropped when the exported packet rate is high and the backoff mechanism is about to or is starting to take effect. The dropEvent counter, in the sFlow packet, is always zero.
- sFlow sampling is done on a per-port basis.
- Community list and local preference fields are not filled up in the extended gateway element in the sFlow datagram.
- The 802.1P source priority field is not filled up in the extended switch element in the sFlow datagram.
- Only Destination and Destination Peer AS numbers are packed in the dst-as-path field in the extended gateway element.
- If the packet being sampled is redirected using policy-based routing (PBR), the sFlow datagram may contain incorrect extended gateway/router information.
- sFlow does not support packing extended information for IPv6 packets. Only the first 128 bytes of the IPv6 packet is shipped in the datagram.
- The source virtual local area network (VLAN) field in the extended switch element is not packed if there is a routed packet.
- The destination VLAN field in the extended switch element is not packed if there is a multicast packet.
- The sFlow sampling functionality is supported only for egress traffic and not for ingress traffic.
- The maximum number of packets that can be sampled and processed per second is:
  - 7500 packets when no extended information packing is enabled.
  - 7500 packets when only extended-switch information packing is enabled (refer to [sflow extended-switch enable](#)).

# sflow collector

Configure a collector device to which sFlow datagrams are forwarded.

## Syntax

```
sflow collector {ip-address | ipv6-address} agent-addr {ip-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]
```

To delete a configured collector, use the `no sflow collector {ip-address | ipv6-address} agent-addr {ipv4-address | ipv6-address} [number [max-datagram-size number]] | [max-datagram-size number] [vrf management]` command.

## Parameters

**sflow collector**  
**ip-address |**  
**ipv6-address**

Enter the IP address of the collector in dotted decimal format for IPv4 or x:x:x:x format for IPv6.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**agent-addr ip-address |**  
**ipv6-address**

Enter the keyword `agent-addr` followed by the sFlow agent IP address in dotted decimal format for IPv4 or x:x:x:x format for IPv6.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**number**

(OPTIONAL) Enter the user datagram protocol (UDP) port number. The range is from 0 to 65535. The default is 6343.

**max-datagram-size**  
**number**

(OPTIONAL) Enter the keyword `max-datagram-size` then the size number in bytes. The range is from 400 to 1500. The default is **1400**.

**vrf**  
**management**

(OPTIONAL) Enter the keyword `vrf` followed by the keyword `management` to configure the collector device corresponding to the default VRF and the management VRF respectively.

## Defaults

Not configured.

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version   | Description                                                                                           |
|-----------|-------------------------------------------------------------------------------------------------------|
| 9.4.(0.0) | Added support for VRF.                                                                                |
| 9.0.2.0   | Introduced on the S6000.                                                                              |
| 8.3.19.0  | Introduced on the S4820T.                                                                             |
| 8.3.11.1  | Introduced on the Z9000.                                                                              |
| 8.4.2.3   | Added support for IPv6 sFlow collectors and agents on the E-series TeraScale, C-Series, and S-Series. |
| 8.4.1.1   | Added support for IPv6 sFlow collectors and agents on the E-series ExaScale.                          |
| 8.3.7.0   | Introduced on the S4810.                                                                              |
| 8.2.1.0   | Introduced S-Series Stacking.                                                                         |
| 8.1.1.0   | Introduced on the E-Series ExaScale.                                                                  |
| 7.7.1.0   | Introduced on the S-Series.                                                                           |
| 7.6.1.0   | Introduced on the C-Series.                                                                           |
| 6.5.1.0   | Expanded the <code>no</code> form of the command to mirror the syntax used to configure.              |
| 6.2.1.1   | Introduced on the E-Series.                                                                           |

#### Usage Information

You can configure up to two sFlow collectors (IPv4 or IPv6). If two collectors are configured, traffic samples are sent to both.

The sFlow agent address is carried in a field in SFlow packets and is used by the collector to identify the sFlow agent.

In sFlow, the agent address is a single invariant IPv4 or IPv6 address used to identify the agent to the collector. It is usually assigned the address of a loopback interface on the agent, which provides invariance. The agent address is carried as a field in the payload of the sFlow packets.

As part of the sFlow-MIB, if the SNMP request originates from a configured collector, Dell Networking OS returns the corresponding configured agent IP in the MIB requests. Dell Networking OS checks to ensure that two entries are not configured for the same collector IP with a different agent IP. Should that happen, Dell Networking OS generates the following error: `%Error: Different agent-addr attempted for an existing collector.`

#### Example

```
Dell(conf)#sflow collector 10.1.1.25 agent-addr 10.1.1.10 vrf
management
```

## sflow enable (Global)

Enable sFlow globally.

**Syntax** `sflow enable`  
To disable sFlow, use the `no sflow enable` command.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced S-Series Stacking.        |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 6.2.1.1  | Introduced on the E-Series.          |

**Usage Information** sFlow is disabled by default. In addition to this command, sFlow needs to be enable on individual interfaces where sFlow sampling is desired.

**Related Commands** [sflow enable \(Interface\)](#) — enables sFlow on interfaces.

## sflow ingress-enable

Enable sFlow ingress on interfaces.

**Syntax** `sflow ingress-enable`  
To disable sFlow, use the `no sflow ingress enable` command.

| <b>Defaults</b>          | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                             |          |                                                       |

## sflow extended-switch enable

Enable packing information on a switch only.

|                        |                                                                                                                                                                                                                                                                 |               |                                                                              |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------------------------------------------------------------------------------|
| <b>Syntax</b>          | <pre>sflow extended-switch enable</pre> <p>To disable packing information, use the <code>no sflow extended-switch [enable]</code> command.</p>                                                                                                                  |               |                                                                              |
| <b>Parameters</b>      | <table border="0"> <tr> <td><b>enable</b></td> <td>Enter the keyword <code>enable</code> to enable global extended information.</td> </tr> </table>                                                                                                             | <b>enable</b> | Enter the keyword <code>enable</code> to enable global extended information. |
| <b>enable</b>          | Enter the keyword <code>enable</code> to enable global extended information.                                                                                                                                                                                    |               |                                                                              |
| <b>Defaults</b>        | Disabled.                                                                                                                                                                                                                                                       |               |                                                                              |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                   |               |                                                                              |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |               |                                                                              |

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on S-Series Stacking.     |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 7.4.1.0  | Introduced on the E-Series.          |

**Usage Information**

Dell Networking OS enhances the sflow implementation for real time traffic analysis on the E-Series to provide extended gateway information in cases where the destination IP addresses are learned by different routing protocols and for cases where the destination is reachable over ECMP.

**Related Commands**

[show sflow](#) — displays the sFlow configuration.

## sflow max-header-size extended

Set the maximum header size of a packet to 256 bytes.

**Syntax**

`sflow max-header-size extended`

To reset the maximum header size of a packet, use the `[no] sflow max-header-size extended` command.

**Parameters**

**extended**

Enter the keyword `extended` to copy 256 bytes from the sample packets to sFlow datagram.

**Defaults**

**128** bytes

**Command Modes**

CONFIGURATION

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                       |
|----------|---------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                       |
| 9.7(0.0) | Introduced on the S Series and Z Series switches. |

**Example** `Dell(conf)#sflow max-header-size extended`

## sflow polling-interval (Global)

Set the sFlow polling interval at a global level.

**Syntax** `sflow polling-interval interval value`  
 To return to the default, use the `no sflow polling-interval interval` command.

**Parameters** `interval value` Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is **20 seconds**.

**Defaults** **20 seconds**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on S-Series Stacking.     |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 7.4.1.0  | Introduced on the E-Series.          |

**Usage Information**

The polling interval for an interface is the maximum number of seconds between successive samples of counters sent to the collector. This command changes the global default counter polling (20 seconds) interval. You can configure an interface to use a different polling interval.

**Related Commands**

[sflow polling-interval \(Interface\)](#) – sets the polling interval for an interface.

## sflow polling-interval (Interface)

Set the sFlow polling interval at an interface (overrides the global-level setting.)

**Syntax**

```
sflow polling-interval interval value
```

To return to the default, use the `no sflow polling-interval interval` command.

**Parameters**

*interval value*

Enter the interval value in seconds. The range is from 15 to 86400 seconds. The default is **the global counter polling interval**.

**Defaults**

The same value as the current global default counter polling interval.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| <b>Related Commands</b>  | <a href="#">sflow polling-interval (Global)</a> — globally sets the polling interval. |

## sflow sample-rate (Global)

Change the global default sampling rate.

|               |                                                                                            |
|---------------|--------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>sflow sample-rate value</code>                                                       |
|               | To return to the default sampling rate, use the <code>no sflow sample-rate</code> command. |

|                   |              |                                                                                                                                                                                                                            |
|-------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>value</b> | Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, and so on. The default is <b>32768 packets</b> . |
|-------------------|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                 |                      |
|-----------------|----------------------|
| <b>Defaults</b> | <b>32768 packets</b> |
|-----------------|----------------------|

|                      |               |
|----------------------|---------------|
| <b>Command Modes</b> | CONFIGURATION |
|----------------------|---------------|

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on S-Series Stacking.     |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 7.4.1.0  | Introduced on the E-Series.          |

**Usage Information**

Sample-rate is the average number of packets skipped before the sample is taken. This command changes the global default sampling rate. You can configure an interface to use a different sampling rate than the global sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power of 2 value. Select one of these two packet numbers and re-enter the command.

**Related Commands**

[sflow sample-rate \(Interface\)](#) – changes the interface sampling rate.

## sflow sample-rate (Interface)

Change the interface default sampling rate.

**Syntax**

```
sflow sample-rate value
```

To return to the default sampling rate, use the `no sflow sample-rate` command.

**Parameters**

**value**

Enter the sampling rate value. For the C-Series and S-Series, the range is from 256 to 8388608 packets. Enter values in powers of 2 only; for example, 4096, 8192, 16384, etc. The default is **32768** packets.

**Defaults**

The Global default sampling.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on S-Series Stacking.     |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |

| Version | Description                 |
|---------|-----------------------------|
| 7.6.1.0 | Introduced on the C-Series. |
| 6.2.1.1 | Introduced on the E-Series. |

### Usage Information

This command changes the sampling rate for an interface. By default, the sampling rate of an interface is set to the same value as the current global default sampling rate. If the value entered is not a correct power of 2, the command generates an error message with the previous and next power-of-2 value. Select one of these two number and re-enter the command.

### Related Commands

[sflow sample-rate \(Global\)](#) — changes the sampling rate globally.

## show sflow

Display the current sFlow configuration.

### Syntax

```
show sflow [interface]
```

### Parameters

#### *interface*

(OPTIONAL) Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 100/1000 Ethernet interface, enter the keyword `GigabitEthernet` then the slot/port information.

### Command Modes

- EXEC
- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                          |
|----------|--------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.          |
| 9.0.2.0  | Introduced on the S6000.             |
| 8.3.19.0 | Introduced on the S4820T.            |
| 8.3.11.1 | Introduced on the Z9000.             |
| 8.3.7.0  | Introduced on the S4810.             |
| 8.2.1.0  | Introduced on S-Series Stacking.     |
| 8.1.1.0  | Introduced on the E-Series ExaScale. |
| 7.7.1.0  | Introduced on the S-Series.          |
| 7.6.1.0  | Introduced on the C-Series.          |
| 6.2.1.1  | Introduced on the E-Series.          |

**Usage Information**

The dropEvent counter (sFlow samples dropped due to sub-sampling) shown in the following example always displays a value of zero.

**Example**

```
Dell#show sflow
sFlow services are enabled
Egress Management Interface sFlow services are disabled
Global default sampling rate: 32768
Global default counter polling interval: 20
Global default extended maximum header size: 128 bytes
Global extended information enabled: none
1 collectors configured
Collector IP addr: 100.1.1.1, Agent IP addr: 1.1.1.2, UDP
port: 6343 VRF: Default
0 UDP packets exported
0 UDP packets dropped
0 sFlow samples collected

stack-unit 1 Port set 1
  Te 1/1: configured rate 16384, actual rate 16384 <<<
sampling rate based on line speed if global sampling rate is
default
Dell#
```

# Simple Network Management Protocol (SNMP) and Syslog

This chapter contains commands to configure and monitor the simple network management protocol (SNMP) v1/v2/v3 and Syslog. Both features are supported on Dell Networking OS.

The chapter contains the following sections:

- [SNMP Commands](#)
- [Syslog Commands](#)

## SNMP Commands

The following SNMP commands are available in the Dell Networking OS.

The simple network management protocol (SNMP) is used to communicate management information between the network management stations and the agents in the network elements. Dell Networking OS supports SNMP versions 1, 2c, and 3, supporting both read-only and read-write modes. Dell Networking OS sends SNMP traps, which are messages informing an SNMP management system about the network. Dell Networking OS supports up to 16 SNMP trap receivers.

### Important Points to Remember

- Typically, 5-second timeout and 3-second retry values on an SNMP server are sufficient for both LAN and WAN applications. If you experience a timeout with these values, the recommended best practice on Dell Networking switches (to accommodate their high port density) is to increase the timeout and retry values on your SNMP server to the following:
  - SNMP Timeout — greater than 3 seconds.
  - SNMP Retry count — greater than 2 seconds.
- If you want to query an E-Series switch using SNMP v1/v2/v3 with an IPv6 address, configure the IPv6 address on a non-management port on the switch.
- If you want to send SNMP v1/v2/v3 traps from an E-Series using an IPv6 address, use a non-management port.
- SNMP v3 informs are not currently supported with IPv6 addresses.
- If you are using access control lists (ACLs) in an SNMP v3 configuration, group ACL overrides user ACL if the user is part of that group.
- SNMP operations are not supported on a virtual local area network (VLAN).

## show snmp

Display the status of SNMP network elements.

|                      |                                                                             |
|----------------------|-----------------------------------------------------------------------------|
| <b>Syntax</b>        | show snmp                                                                   |
| <b>Command Modes</b> | <ul style="list-style-type: none"><li>EXEC</li><li>EXEC Privilege</li></ul> |

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

### E-Series legacy command

### Example

```
Dell#show snmp
 32685 SNMP packets input
   0 Bad SNMP version errors
   0 Unknown community name
   0 Illegal operation for community name supplied
   0 Encoding errors
 96988 Number of requested variables
   0 Number of altered variables
 31681 Get-request PDUs
   968 Get-next PDUs
   0 Set-request PDUs
 61727 SNMP packets output
   0 Too big errors (Maximum packet size 1500)
   9 No such name errors
   0 Bad values errors
   0 General errors
 32649 Response PDUs
 29078 Trap PDUs
Dell#
```

**Related Commands** [snmp-server community](#) — enables the SNMP and set community string.

## show snmp engineID

Display the identification of the local SNMP engine and all remote engines that are configured on the router.

**Syntax**                    show snmp engineID

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**                    This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**Example**

```
Dell#show snmp engineID
Local SNMP engineID: 0000178B02000001E80214A8
Remote Engine ID      IP-addr      Port
80001F88043132333435  172.31.1.3   5009
80001F88043938373635  172.31.1.3   5008
Dell#
```

**Related Commands**                    [snmp-server engineID](#) — configures local and remote SNMP engines on the router.

## show snmp group

Display the group name, security model, status, and storage type of each group.

**Syntax**                    show snmp group

**Command Modes**

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

### E-Series legacy command

## Usage Information

The following Example displays a group named *ngroup*. The *ngroup* has a security model of version 3 (v3) with authentication (`auth`), the read and notify name is *nview* with no write view name specified, and finally the row status is active.

## Example

```
Dell#show snmp group
groupname: v1v2creadg      security model: v1
readview : v1v2cdefault    writeview: no write view specified
notifyview: v1v2cdefault  context: no context specified
row status: active
Dell#
```

## Related Commands

[snmp-server group](#) — configures an SNMP server group.

## show snmp user

Display the information configured on each SNMP user name.

**Syntax**                    `show snmp user`

## Command Modes

- EXEC
- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

```

## snmp-server community

Configure a new community string access for SNMPv1 v2 and v3.

### Syntax

```
snmp-server community community-name {ro | rw} [ipv6 ipv6-
access-list-name [ipv6 ipv6-access-list-name | access-list-name
| security-name name] | security-name name [ipv6 ipv6-access-
list-name | access-list-name | security-name name] | access-
list-name [ipv6 ipv6-access-list-name | access-list-name |
security-name name]]
```

To remove access to a community, use the `no snmp-server community community-string {ro | rw} [security-name name [access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]]` command.

### Parameters

|                                     |                                                                                                           |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b><i>community-name</i></b>        | Enter a text string (up to 20 characters long) to act as a password for SNMP.                             |
| <b>ro</b>                           | Enter the keyword <code>ro</code> to specify read-only permission.                                        |
| <b>rw</b>                           | Enter the keyword <code>rw</code> to specify read-write permission.                                       |
| <b>ipv6 <i>access-list-name</i></b> | (Optional) Enter the keyword <code>ipv6</code> then an IPv6 ACL name (a string up to 16 characters long). |

**security-name name** (Optional) Enter the keywords `security-name` then the security name as defined by the community MIB.

**access-list-name** (Optional) Enter a standard IPv4 access list name (a string up to 16 characters long).

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information**

The following example configures a community named *public* that is mapped to the security named *guestuser* with Read Only (*ro*) permissions.

The `security-name` parameter maps the community string to an SNMPv3 user/ security name as defined by the community MIB.

If a community string is configured without a `security-name` (for example, `snmp-server community public ro`), the community is mapped to a default `security-name/group`:

- `v1v2creadu / v1v2creadg` – maps to a community with *ro* (read-only) permissions.
- `v1v2cwriteu/ v1v2cwriteg` – maps to a community with *rw* (read-write) permissions.

The `community-name` parameter indexes this command.

If you do not configure the `snmp-server community` command, you cannot query SNMP data. Only Standard IPv4 ACL and IPv6 ACL is supported in the optional `access-list-name`.

The command options `ipv6`, `security-name`, and `access-list-name` are recursive. In other words, each option can, in turn, accept any of the three options

as a sub-option, and each of those sub-options can accept any of the three sub-options as a sub-option, and so forth. The second Example shows the creation of a standard IPv4 ACL called *snmp-ro-acl* and then assigning it to the SNMP community *guest*.

**NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP; TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs, port rules are not valid for SNMP.

#### Example

```
Dell#config
Dell(conf)# snmp-server community public ro
Dell(conf)# snmp-server community guest ro security-name
guestuser
Dell(conf)#
```

#### Example

```
Dell(conf)# ip access-list standard snmp-ro-acl
Dell(config-std-nacl)#seq 5 permit host 10.10.10.224
Dell(config-std-nacl)#seq 10 deny any count
!

Dell(conf)#snmp-server community guest ro snmp-ro-acl
Dell(conf)#
```

#### Related Commands

[ip access-list standard](#) — names (or selects) a standard access list to filter based on IP address.

[ipv6 access-list](#) — configures an access list based on IPv6 addresses or protocols.

[show running-config](#) — displays the current SNMP configuration and defaults.

## snmp-server contact

Configure contact information for troubleshooting this SNMP node.

#### Syntax

```
snmp-server contact text
```

To delete the SNMP server contact information, use the `no snmp-server contact` command.

#### Parameters

**text** Enter an alphanumeric text string, up to 55 characters long.

#### Defaults

none

#### Command Modes

CONFIGURATION

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

| <b>E-Series legacy command</b> |                             |

## snmp-server enable traps

Enable SNMP traps.

### Syntax

```
snmp-server enable traps [notification-type] [notification-option]
```

To disable traps, use the `no snmp-server enable traps [notification-type] [notification-option]` command.

### Parameters

#### *notification-type*

Enter the type of notification from the following list:

- `bgp` — Notification of changes in the BGP process.
- `config` — Notification of changes to the startup or running configuration.
- `ecfm` — Notification of changes to ECFM.
- `ecmp` — Enable an ECMP trap to notify of ECMP or link bundle traffic imbalances.
- `envmon` — For Dell Networking device notifications when an environmental threshold is exceeded.
- `isis` — Notification of intermediate service traps.
- `lacp` — Notification of changes.
- `snmp` — Notification of RFC 1157 traps.
- `stp` — Notification of a state change in the spanning tree protocol (RFC 1493).
- `vlt` — Notification of virtual link trunking.
- `vrrp` — Notification of a state change in a VRRP group.
- `xstp` — Notification of a state change in MSTP (802.1s), RSTP (802.1w), and PVST+.

#### *notification-option*

For the `envmon` notification-type, enter one of the following optional parameters:

- cam-utilization
- fan
- supply
- temperature

For the `snmp notification-type`, enter one of the following optional parameters:

- authentication
- coldstart
- linkdown
- linkup
- syslog-reachable
- syslog-unreachable

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                                                            |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------|
| 9.8(0.0)                       | Added the following two SNMP notification options: <code>syslog-reachable</code> and <code>syslog-unreachable</code> . |
| 9.7(0.0)                       | Introduced on the S6000-ON.                                                                                            |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.                    |
| 9.0.2.0                        | Introduced on the S6000.                                                                                               |
| 9.1(0.0)                       | Added support for copy-config and ECMP traps.                                                                          |
| 8.3.19.0                       | Introduced on the S4820T.                                                                                              |
| 8.3.11.1                       | Introduced on the Z9000.                                                                                               |
| 8.3.7.0                        | Introduced on the S4810.                                                                                               |
| 8.4.1.0                        | Added support for VRRP traps.                                                                                          |
| 7.6.1.0                        | Added support for STP and xSTP traps. Introduced on the S-Series.                                                      |
| 7.5.1.0                        | Introduced on the C-Series.                                                                                            |
| <b>E-Series legacy command</b> |                                                                                                                        |

## Usage Information

Dell Networking OS supports up to 16 SNMP trap receivers.

For the `cam-utilization` notification option, the system generates syslogs and SNMP traps when the L3 host table or route table utilization goes above the threshold.

If you do not configure this command, traps that controlled by this command are not sent. If you do not specify a `notification-type` and `notification-option`, all traps are enabled.

## Related Commands

[snmp-server community](#) — enables SNMP and sets the community string.

## snmp-server engineID

Configure the name for both the local and remote SNMP engines on the router.

### Syntax

```
snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]
```

To return to the default, use the `no snmp-server engineID [local engineID] [remote ip-address vrf vrf-name udp-port port-number engineID]` command.

### Parameters

#### **local engineID**

Enter the keyword `local` followed by the engine ID number that identifies the copy of the SNMP on the local device.

Format (as specified in RFC 3411): 12 octets.

- The first four octets are set to the private enterprise number.
- The remaining eight octets are the MAC address of the chassis.

#### **remote ip-address**

Enter the keyword `remote` followed by the IP address that identifies the copy of the SNMP on the remote device.

#### **vrf vrf-name**

Enter the keyword `vrf` followed by the name of the VRF that is used to reach the device.

**NOTE:** Use this attribute to specify the VRF that is used by the SNMP engine to reach the device. If no VRF is specified, then the default VRF is used.

#### **udp-port port-number engineID**

Enter the keywords `udp-port` followed by the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is **162**.

### Defaults

As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.4.(0.0) | Added support for VRF.      |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.19.0  | Introduced on the S4820T.   |
| 8.3.11.1  | Introduced on the Z9000.    |
| 8.3.7.0   | Introduced on the S4810.    |
| 7.6.1.0   | Introduced on the S-Series. |
| 7.5.1.0   | Introduced on the C-Series. |

#### E-Series legacy command

#### Usage Information

Changing the value of the SNMP Engine ID has important side effects. A user's password (entered on the command line) is converted to a message digest algorithm (MD5) or secure hash algorithm (SHA) security digest. This digest is based on both the password and the local Engine ID. The command line password is then destroyed, as required by RFC 2274. Because of this deletion, if the local value of the Engine ID changes, the security digests of SNMPv3 users is invalid and the users will have to be reconfigured.

For the remote Engine ID, the host IP and UDP port are the indexes to the command that are matched to either overwrite or remove the configuration.

#### Related Commands

[show snmp engineID](#) — displays the SNMP engine and all the remote engines that are configured on the router.

[show running-config snmp](#) — displays the SNMP running configuration.

## snmp-server group

Configure a new SNMP group or a table that maps SNMP users to SNMP views.

**Syntax**

```
snmp-server group [group_name {1 | 2c | 3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a specified group, use the `no snmp-server group [group_name {v1 | v2c | v3 {auth | noauth | priv}}] [read name] [write name] [notify name] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

## Parameters

|                                |                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>group_name</b>              | Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults): <ul style="list-style-type: none"> <li>v1v2creadg — maps to a community/security-name with <code>ro</code> permissions.</li> <li>1v2cwriteg — maps to a community/security-name <code>rw</code> permissions.</li> </ul> |
| <b>1   2c   3</b>              | (OPTIONAL) Enter the security model version number (1, 2c, or 3): <ul style="list-style-type: none"> <li>1 is the least secure version.</li> <li>3 is the most secure of the security modes.</li> <li>2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li> </ul> <p>The default is <b>1</b>.</p>                        |
| <b>auth</b>                    | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                                         |
| <b>noauth</b>                  | (OPTIONAL) Enter the keyword <code>noauth</code> to specify no authentication of a packet.                                                                                                                                                                                                                                                                                                       |
| <b>priv</b>                    | (OPTIONAL) Enter the keyword <code>priv</code> to specify both authentication and then scrambling of the packet.                                                                                                                                                                                                                                                                                 |
| <b>read name</b>               | (OPTIONAL) Enter the keyword <code>read</code> then a name (a string of up to 20 characters long) as the read view name. The default is <b>GlobalView</b> and is assumed to be every object belonging to the internet (1.3.6.1) OID space.                                                                                                                                                       |
| <b>write name</b>              | (OPTIONAL) Enter the keyword <code>write</code> then a name (a string of up to 20 characters long) as the write view name.                                                                                                                                                                                                                                                                       |
| <b>notify name</b>             | (OPTIONAL) Enter the keyword <code>notify</code> then a name (a string of up to 20 characters long) as the notify view name.                                                                                                                                                                                                                                                                     |
| <b>access access-list-name</b> | (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                                                         |
| <b>ipv6 access-list-name</b>   | (Optional) Enter the keyword <code>ipv6</code> then the IPv6 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                                                               |

***access-list-name ipv6 access-list-name*** (Optional) Enter both an IPv4 and IPv6 access list name.

**Defaults** As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                          |
|--------------------------------|------------------------------------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON.                          |
| 9.0.2.0                        | Introduced on the S6000.                             |
| 8.3.19.0                       | Introduced on the S4820T.                            |
| 8.3.11.1                       | Introduced on the Z9000.                             |
| 8.3.10.2                       | Added support for the <code>access</code> parameter. |
| 8.3.7.0                        | Introduced on the S4810.                             |
| 7.6.1.0                        | Introduced on the S-Series.                          |
| 7.5.1.0                        | Introduced on the C-Series.                          |
| <b>E-Series legacy command</b> |                                                      |

**Usage Information** The following Example specifies the group named *harig* as a version 3 user requiring both authentication and encryption and read access limited to the read named *rview*.

 **NOTE:** The number of configurable groups is limited to 16 groups.

**Example**  
Dell#conf  
Dell(conf)# snmp-server group harig 3 priv read rview  
Dell#

**Related Commands** [show snmp group](#) — displays the group name, security model, view status, and storage type of each group.

[show running-config](#) — displays the SNMP running configuration.

## snmp-server host

Configure the recipient of an SNMP trap operation.

**Syntax**

```
snmp-server host ip-address | ipv6-address [vrf vrf-name] traps
| informs [version 1 | 2c | 3] [auth | no auth | priv]
[community-string] [udp-port port-number] [notification-type]
```

To remove the SNMP host, use the `no snmp-server host ip-address [vrf vrf-name] traps | informs [version 1 | 2c | 3] [auth | noauth | priv] [community-string] [udp-port number] [notification-type]` command.

### Parameters

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address</i></b>   | Enter the keyword <code>host</code> then the IP address of the host (configurable hosts is limited to 16).                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>ipv6-address</i></b> | Enter the keyword <code>host</code> then the IPv6 address of the host in the <code>x:x:x:x::x</code> format.<br> <b>NOTE:</b> The <code>::</code> notation specifies successive hexadecimal fields of zero.                                                                                                                                                                            |
| <b><i>vrf vrf-name</i></b> | Enter the keyword <code>vrf</code> and then the name of the VRF that the SNMP server uses to connect to the host.<br> <b>NOTE:</b> You can use this attribute to inform the SNMP engine about the <code>vrf</code> instance to be used to reach the corresponding remote host to send Trap or Inform message. If no VRF is specified, then the default VRF is used.                   |
| <b>traps</b>               | (OPTIONAL) Enter the keyword <code>traps</code> to send trap notifications to the specified host. The default is <b>traps</b> .                                                                                                                                                                                                                                                                                                                                         |
| <b>informs</b>             | (OPTIONAL) Enter the keyword <code>informs</code> to send inform notifications to the specified host. The default is <b>traps</b> .                                                                                                                                                                                                                                                                                                                                     |
| <b>version 1   2c   3</b>  | (OPTIONAL) Enter the keyword <code>version</code> to specify the security model then the security model version number 1, 2c, or 3: <ul style="list-style-type: none"><li>• Version 1 is the least secure version.</li><li>• Version 3 is the most secure of the security modes.</li><li>• Version 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li></ul> The default is version <b>1</b> . |
| <b>auth</b>                | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                                                                                                                |

**noauth** (OPTIONAL) Enter the keyword `noauth` to specify no authentication of a packet.

**priv** (OPTIONAL) Enter the keyword `priv` to specify both authentication and then scrambling of the packet.

**community-string** Enter a text string (up to 20 characters long) as the name of the SNMP community.

**NOTE:** For version 1 and version 2c security models, this string represents the name of the SNMP community. The string can be set using this command; however, Dell Networking OS recommends setting the community string using the `snmp-server community` command before executing this command. For version 3 security model, this string is the USM user security name.

**udp-port port-number** (OPTIONAL) Enter the keywords `udp-port` followed by the port number of the remote host to use. The range is from 0 to 65535. The default is **162**.

**notification-type** (OPTIONAL) Enter one of the following keywords for the type of trap to be sent to the host:

- `bgp` — Enable BGP state change traps.
- `ecfm` — Enable ECFM state change traps.
- `entity` — Enable entity change traps.
- `envmon` — Enable SNMP environmental monitor traps.
- `eoam` — Enable EOAM state change traps
- `ets` — Enable ets traps
- `fips` — Enable FIP Snooping state change traps
- `lACP` — Enable LACP state change traps.
- `isis` — Enable ISIS adjacency change traps
- `pfc` — Enable pfc traps
- `snmp` — Enable SNMP trap
- `stp` — Enable 802.1d state change traps
- `vlt` — Enable VLT traps
- `vrrp` — Enable VRRP state change traps
- `xstp` — Enable 802.1s, 802.1w, and PVST+ state change traps

The default is all trap types are sent to host.

**Defaults** As above.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                       |
| 9.4(0.0) | Added support for VRF.                                                            |
| 9.0.2.0  | Introduced on the S6000.                                                          |
| 9.1(0.0) | Added support for config and ecmp traps.                                          |
| 8.3.19.0 | Introduced on the S4820T.                                                         |
| 8.3.11.1 | Introduced on the Z9000.                                                          |
| 8.3.7.0  | Introduced on the S4810.                                                          |
| 8.4.1.0  | Added support for VRRP traps.                                                     |
| 7.6.1.0  | Added support for STP and xSTP notification types.<br>Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series.                                                       |

#### E-Series legacy command

#### Usage Information

In order to configure the router to send SNMP notifications, enter at least one `snmp-server host` command. If you enter the command with no keywords, all trap types are enabled for the host. If you do not enter an `snmp-server host` command, no notifications are sent.

In order to enable multiple hosts, issue a separate `snmp-server host` command for each host. You can specify multiple notification types in the command for each host.

When multiple `snmp-server host` commands are given for the same host and type of notification (trap or inform), each succeeding command overwrites the previous command. Only the last `snmp-server host` command will be in effect. For example, if you enter an `snmp-server host inform` command for a host and then enter another `snmp-server host inform` command for the same host, the second command replaces the first command.

The `snmp-server host` command is used with the `snmp-server enable` command. Use the `snmp-server enable` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server enable` command and the `snmp-server host` command for that host must be enabled.

**NOTE:** For v1 / v2c trap configuration, if the community-string is not defined using the `snmp-server community` command prior to using this command, the default form of the `snmp-server community` command automatically is configured with the community-name the same as specified in the `snmp-server host` command.

## Configuring Informs

To send an inform, use the following steps:

1. Configure a remote engine ID.
2. Configure a remote user.
3. Configure a group for this user with access rights.
4. Enable traps.
5. Configure a host to receive informs.

### Related Commands

[snmp-server enable traps](#) — enables SNMP traps.

[snmp-server community](#) — configures a new community SNMPv1 or SNMPv2c.

## snmp-server location

Configure the location of the SNMP server.

**Syntax** `snmp-server location text`

To delete the SNMP location, use the `no snmp-server location` command.

### Parameters

**text** Enter an alpha-numeric text string, up to 55 characters long.

**Defaults** Not configured.

**Command  
Modes** CONFIGURATION

**Command  
History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                            | Description                 |
|------------------------------------|-----------------------------|
| 9.7(0.0)                           | Introduced on the S6000-ON. |
| 9.0.2.0                            | Introduced on the S6000.    |
| 8.3.19.0                           | Introduced on the S4820T.   |
| 8.3.11.1                           | Introduced on the Z9000.    |
| 8.3.7.0                            | Introduced on the S4810.    |
| 7.6.1.0                            | Introduced on the S-Series. |
| 7.5.1.0                            | Introduced on the C-Series. |
| <b>E-Series legacy<br/>command</b> |                             |

## snmp-server packetsize

Set the largest SNMP packet size permitted. When the SNMP server is receiving a request or generating a reply, use the `snmp-server packetsize global` configuration command.

|                        |                                                                                                                                                                |                                                                                                                            |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>snmp-server packetsize <i>byte-count</i></code>                                                                                                          |                                                                                                                            |
| <b>Parameters</b>      | <b><i>byte-count</i></b>                                                                                                                                       | Enter one of the following values 8, 16, 24 or 32. Packet sizes are 8000 bytes, 16000 bytes, 32000 bytes, and 64000 bytes. |
| <b>Defaults</b>        | <b>8</b>                                                                                                                                                       |                                                                                                                            |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |                                                                                                                            |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                            |

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                 |
|--------------------------------|-----------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON. |
| 9.0.2.0                        | Introduced on the S6000.    |
| 8.3.19.0                       | Introduced on the S4820T.   |
| 8.3.11.1                       | Introduced on the Z9000.    |
| 8.3.7.0                        | Introduced on the S4810.    |
| 7.6.1.0                        | Introduced on the S-Series. |
| 7.5.1.0                        | Introduced on the C-Series. |
| <b>E-Series legacy command</b> |                             |

## snmp-server trap-source

Configure a specific interface as the source for SNMP traffic.

|                   |                                                                                                                                                               |                                                                                                                                                                                                                                            |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>snmp-server trap-source <i>interface</i></code><br>To disable sending traps out a specific interface, use the <code>no snmp trap-source</code> command. |                                                                                                                                                                                                                                            |
| <b>Parameters</b> | <b><i>interface</i></b>                                                                                                                                       | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"><li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li></ul> |

- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a port channel interface, enter the keywords `port-channel` then a number.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults**

The IP address assigned to the management interface is the default.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.3.7.0  | Introduced on the S4810.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |

**E-Series legacy command**

**Usage Information**

To enable this `snmp-server trap-source` command, configure an IP address on the interface and enable the interface configured as an SNMP trap source.

**Related Commands**

[snmp-server community](#) – sets the community string.

## snmp-server user

Configure a new user to an SNMP group.

**Syntax**

```
snmp-server user name {group_name remote ip-address vrf vrf-name
udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha}
auth-password] [priv {des56 | aes128} priv password]
```

```
[access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]
```

To remove a user from the SNMP group, use the `no snmp-server user name {group_name remote ip-address vrf vrf-name udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128} priv password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

## Parameters

|                             |                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>name</b>                 | Enter the name of the user (not to exceed 20 characters), on the host that connects to the agent.                                                                                                                                                                                                                                                                                               |
| <b>group_name</b>           | Enter a text string (up to 20 characters long) as the name of the group. The following groups are created for mapping to read/write community/security-names (defaults): <ul style="list-style-type: none"><li>• <code>v1v2creadu</code> — maps to a community with <code>ro</code> permissions.</li><li>• <code>1v2cwriteu</code> — maps to a community <code>rw</code> permissions.</li></ul> |
| <b>remote ip-address</b>    | Enter the keywords <code>udp-port</code> then the user datagram protocol (UDP) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> .                                                                                                                                                                                                                      |
| <b>vrf vrf-name</b>         | Enter the keywords <code>vrf</code> and then the name of the VRF this is used to connect to the SNMP server.<br> <b>NOTE:</b> Use this attribute to specify a VRF name that is used to connect to the remote host. If no VRF is specified, then the default VRF is used.                                     |
| <b>udp-port port-number</b> | Enter the keywords <code>udp-port</code> then the UDP (User Datagram Protocol) port number on the remote device. The range is from 0 to 65535. The default is <b>162</b> .                                                                                                                                                                                                                      |
| <b>1   2c   3</b>           | (OPTIONAL) Enter the security model version number (1, 2c, or 3): <ul style="list-style-type: none"><li>• 1 is the least secure version.</li><li>• 3 is the most secure of the security modes.</li><li>• 2c allows transmission of informs and counter 64, which allows for integers twice the width of what is normally allowed.</li></ul> The default is <b>1</b> .                           |
| <b>encrypted</b>            | (OPTIONAL) Enter the keyword <code>encrypted</code> to specify the password appear in encrypted format (a series of digits, masking the true characters of the string).                                                                                                                                                                                                                         |
| <b>auth</b>                 | (OPTIONAL) Enter the keyword <code>auth</code> to specify authentication of a packet without encryption.                                                                                                                                                                                                                                                                                        |

|                                               |                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>md5   sha</b>                              | (OPTIONAL) Enter the keyword <code>md5</code> or <code>sha</code> to designate the authentication level. <ul style="list-style-type: none"> <li><code>md5</code> — Message Digest Algorithm</li> <li><code>sha</code> — Secure Hash Algorithm</li> </ul>                                                                |
| <b>auth-password</b>                          | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host. Minimum: eight characters long.                                                                                                                                                             |
| <b>priv</b>                                   | (OPTIONAL) Enter the keywords <code>priv</code> to initiate a privacy authentication level setting.                                                                                                                                                                                                                     |
| <b>des56   aes128</b>                         | (OPTIONAL) Enter the keyword <code>des56</code> or <code>aes128</code> to specify the encryption mode. <ul style="list-style-type: none"> <li><code>aes128</code> — Use 128 bit AES algorithm in CFB mode for encryption.</li> <li><code>des56</code> — Use 56 bit DES algorithm in CBC mode for encryption.</li> </ul> |
| <b>priv password</b>                          | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent. Minimum: eight characters long.                                                                                                                                  |
| <b>access access-list-name</b>                | (Optional) Enter the standard IPv4 access list name (a string up to 16 characters long).                                                                                                                                                                                                                                |
| <b>ipv6 access-list-name</b>                  | (Optional) Enter the keyword <code>ipv6</code> then the IPv6 access list name (a string up to 16 characters long).                                                                                                                                                                                                      |
| <b>access-list-name ipv6 access-list-name</b> | (Optional) Enter both an IPv4 and IPv6 access list name.                                                                                                                                                                                                                                                                |

**Defaults**

As above.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                   |
|-----------|-----------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.                   |
| 9.6.(0.0) | Added aes 128 encryption algorithm parameter. |
| 9.4.(0.0) | Added support for VRF.                        |

| Version  | Description                 |
|----------|-----------------------------|
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |

#### Usage Information

**NOTE:** For IPv6 ACLs, only IPv6 and UDP types are valid for SNMP. TCP and ICMP rules are not valid for SNMP. In IPv6 ACLs port rules are not valid for SNMP.

No default values exist for authentication or privacy algorithms and no default password exists. If you forget a password, you cannot recover it; the user must be reconfigured. You can specify either a plain-text password or an encrypted cypher-text password. In either case, the password is stored in the configuration in an encrypted form and displayed as encrypted in the `show running-config` command.

If you have an encrypted password, you can specify the encrypted string instead of the plain-text password. The following command is an Example of how to specify the command with an encrypted string.

**NOTE:** The number of configurable users is limited to 16.

#### Example

```
Dell# snmp-server user privuser v3group v3 encrypted auth md5
9fc53d9d908118b2804fe80e3ba8763d priv des56
d0452401a8c3ce42804fe80e3ba8763d
```

#### Usage Information

The following command is an example of how to enter a plain-text password as the string `authpasswd` for user `authuser` of group `v3group`.

#### Example

```
Dell#conf
Dell(conf)# snmp-server user authuser v3group v3 auth md5
authpasswd
```

#### Usage Information

The following command configures a remote user named `n3user` with a `v3` security model and a security level of `authNOPriv`.

#### Example

```
Dell#conf
Dell(conf)# snmp-server user n3user ngroup remote 172.31.1.3
udp-port 5009 3
auth md5 authpasswd
```

#### Related Commands

[show snmp user](#) — displays the information configured on each SNMP user name.

## snmp-server user (for AES128-CFB Encryption)

Specify that AES128-CFB encryption algorithm needs to be used for transmission of SNMP information. The Advanced Encryption Standard (AES) Cipher Feedback (CFB) 128-bit encryption algorithm is in compliance with RFC 3826. RFCs for SNMPv3 define two authentication hash algorithms, namely, HMAC-MD5-96 and HMAC-SHA1-96. These are the full forms or editions of the truncated versions, namely, HMAC-MD5 and HMAC-SHA1 authentication algorithms.

### Z4820T

#### Syntax

```
snmp-server user name {group_name remote ip-address udp-port
port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-
password] [priv {des56 | aes128-cfb} priv-password] [access
access-list-name | ipv6 access-list-name | access-list-name
ipv6 access-list-name]
```

To remove a user from the SNMP group, use the `no snmp-server user name {group_name remote ip-address udp-port port-number} [1 | 2c | 3] [encrypted] [auth {md5 | sha} auth-password] [priv {des56 | aes128-cfb} priv-password] [access access-list-name | ipv6 access-list-name | access-list-name ipv6 access-list-name]` command.

#### Parameters

|                             |                                                                                                                                                                                                                                                              |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>auth-password</i></b> | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the agent to receive packets from the host and to send packets to the host. Minimum: eight characters long.                                                                  |
| <b><i>aes128</i></b>        | (OPTIONAL) Enter the keyword <code>aes128</code> to initiate the AES128-CFB encryption algorithm for transmission of SNMP packets.                                                                                                                           |
| <b><i>priv-password</i></b> | (OPTIONAL) Enter a text string (up to 20 characters long) password that enables the host to encrypt the contents of the message it sends to the agent and to decrypt the contents of the message it receives from the agent. Minimum: eight characters long. |

#### Defaults

If no authentication or privacy option is configured, then the messages are exchanged (attempted anyway) without any authentication or encryption.

| Version  | Description                                                                                              |
|----------|----------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                              |
| 9.3(0.0) | Added support for the AES128-CFB encryption algorithm on the S4820T, S4810, S6000 and Z-Series platforms |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>To enable robust, effective protection and security for SNMP packets transferred between the server and the client, you can use the <code>snmp-server user <i>username</i> group <i>groupname</i> 3 auth <i>authentication-type</i> <i>auth-password</i> priv aes128 <i>priv-password</i></code> to specify that AES128-CFB encryption algorithm needs to be used.</p> <p>You cannot modify the FIPS mode if SNMPv3 users are already configured and present in the system. An error message is displayed if you attempt to change the FIPS mode by using the <code>fips mode enable</code> command in Global Configuration mode. You can enable or disable FIPS mode only if SNMPv3 users are not previously set up. Otherwise, you must remove the previously configured users before you change the FIPS mode.</p> |
| <b>Example</b>           | <pre>Dell# snmp-server user privuser v3group v3 encrypted auth md5 9fc53d9d908118b2804fe80e3ba8763d priv aes128 d0452401a8c3ce42804fe80e3ba8763d</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Related Commands</b>  | <p><a href="#">show snmp user</a> — Displays the information configured on each SNMP user name.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## snmp-server vrf

Configures an SNMP agent to bind to a specific VRF.

|               |                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <pre>snmp-server vrf <i>vrf-name</i></pre> <p>To undo the SNMP agent configuration, use the <code>no snmp-server vrf <i>vrf-name</i></code> command.</p> |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

|                   |                                                                                                                                                  |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <p><b><i>vrf vrf-name</i></b>      Enter the keyword <code>vrf</code> and then the name of the VRF to associate an SNMP agent with that VRF.</p> |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults**      Not Enabled.

**Command Modes**      CONFIGURATION

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                           |
|-----------------|---------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.           |
| <b>9.4(0.0)</b> | Introduced on the S-Series and Z9000. |

**Usage Information**      Use this command to bind an SNMP agent to a VRF. The SNMP agent processes the requests from the interfaces that belong to the specified VRF. If no VRF is specified, then the default VRF is used.

Related  
Commands

[show snmp user](#) — displays the information configured on each SNMP user name.

## snmp-server view

Configure an SNMPv3 view.

**Syntax**

```
snmp-server view view-name oid-tree {included | excluded}
```

To remove an SNMPv3 view, use the `no snmp-server view view-name oid-tree {included | excluded}` command.

**Parameters**

|                  |                                                                                           |
|------------------|-------------------------------------------------------------------------------------------|
| <b>view-name</b> | Enter the name of the view (not to exceed 20 characters).                                 |
| <b>oid-tree</b>  | Enter the OID sub tree for the view (not to exceed 20 characters).                        |
| <b>included</b>  | (OPTIONAL) Enter the keyword <code>included</code> to include the MIB family in the view. |
| <b>excluded</b>  | (OPTIONAL) Enter the keyword <code>excluded</code> to exclude the MIB family in the view. |

**Defaults**

none

**Command  
Modes**

CONFIGURATION

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**E-Series legacy  
command**

**Usage  
Information**

The `oid-tree` variable is a full sub-tree starting from 1.3.6 and cannot specify the name of a sub-tree or a MIB. The following Example configures a view named `rview` that allows access to all objects under 1.3.6.1.

**Example** Dell# conf  
Dell#(conf) snmp-server view rview 1.3.6.1 included

**Related Commands** [show running-config snmp](#) – displays the SNMP running configuration.

## snmp trap link-status

Enable the interface to send SNMP link traps, which indicate whether the interface is up or down.

**Syntax** snmp trap link-status  
To disable sending link trap messages, use the `no snmp trap link-status` command.

**Defaults** Enabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON.                                                                         |
| 9.0.2.0                        | Introduced on the S6000.                                                                            |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                           |
| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Usage Information** If the interface is expected to flap during normal usage, you could disable this command.

# Syslog Commands

The following commands allow you to configure logging functions on all Dell Networking switches.

## clear logging

Clear the messages in the logging buffer.

**Syntax** `clear logging`

**Defaults** none

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON.                                                                         |
| 9.0.2.0                        | Introduced on the S6000.                                                                            |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                           |
| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Related Commands** [show logging](#) — displays logging settings and system messages in the internal buffer.

## clear logging auditlog

Clears audit log.

**Syntax** `clear logging auditlog`

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                             |
|----------|---------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                             |
| 9.5(0.0) | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

**Example** Dell(conf)#clear logging auditlog

**Related Commands** [show logging auditlog](#) — displays audit log

## default logging buffered

Return to the default setting for messages logged to the internal buffer.

**Syntax** default logging buffered

**Defaults** size = 40960; level = 7 or debugging

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

E-Series legacy command

**Related Commands** [logging buffered](#) — sets the logging buffered parameters.

## default logging console

Return the default settings for messages logged to the console.

**Syntax** `default logging console`

**Defaults** **level = 7 or debugging**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                 |
|--------------------------------|-----------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON. |
| 9.0.2.0                        | Introduced on the S6000.    |
| 8.3.19.0                       | Introduced on the S4820T.   |
| 8.3.11.1                       | Introduced on the Z9000.    |
| 8.3.7.0                        | Introduced on the S4810.    |
| 7.6.1.0                        | Introduced on the S-Series. |
| 7.5.1.0                        | Introduced on the C-Series. |
| <b>E-Series legacy command</b> |                             |

**Related Commands** [logging console](#) — sets the logging console parameters.

## default logging monitor

Return to the default settings for messages logged to the terminal.

**Syntax** `default logging monitor`

**Defaults** **level = 7 or debugging**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                 |
|--------------------------------|-----------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON. |
| 9.0.2.0                        | Introduced on the S6000.    |
| 8.3.19.0                       | Introduced on the S4820T.   |
| 8.3.11.1                       | Introduced on the Z9000.    |
| 8.3.7.0                        | Introduced on the S4810.    |
| 7.6.1.0                        | Introduced on the S-Series. |
| 7.5.1.0                        | Introduced on the C-Series. |
| <b>E-Series legacy command</b> |                             |

**Related Commands**

[logging monitor](#) — sets the logging monitor parameters.

[terminal monitor](#) — sends system messages to the terminal/monitor.

## default logging trap

Return to the default settings for logging messages to the Syslog servers.

**Syntax** `default logging trap`

**Defaults** **level = 6 or informational**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                 |
|--------------------------------|-----------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON. |
| 9.0.2.0                        | Introduced on the S6000.    |
| 8.3.19.0                       | Introduced on the S4820T.   |
| 8.3.11.1                       | Introduced on the Z9000.    |
| 8.3.7.0                        | Introduced on the S4810.    |
| 7.6.1.0                        | Introduced on the S-Series. |
| 7.5.1.0                        | Introduced on the C-Series. |
| <b>E-Series legacy command</b> |                             |

**Related  
Commands**

[logging trap](#) — limit messages logged to the Syslog servers based on severity.

## logging

Configure an IP address or host name of a Syslog server where logging messages are sent. Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Syntax** `logging {ip-address | ipv6-address | hostname} {{udp {port}} | {tcp {port}}} [vrf vrf-name]`

To disable logging, use the `no logging` command.

**Parameters**

**ip-address** Enter the IPv4 address in dotted decimal format.

**ipv6-address** Enter the IPv6 address in the x:x:x::X format.

**NOTE:** The :: notation specifies successive hexadecimal fields of zeros.

**hostname** Enter the name of a host already configured and recognized by the switch.

**udp** Enter the keyword `udp` to enable transmission of log message over UDP followed by port number. The default port is 514

**tcp** Enter the keyword `tcp` to enable transmission of log message over TCP followed by port number.

**vrf vrf-name** (Optional) Enter the keyword `vrf` and then the name of the VRF to enable the logging process in VRF mode.

**NOTE:** Use this attribute to specify the VRF that is used to contact the host. By default, the default VRF is used.

**Defaults** Disabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                                                                            |
|-----------|----------------------------------------------------------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.                                                            |
| 9.5(0.0)  | Added <b>udp</b> and <b>tcp</b> keywords for the S4810, S4820T, S6000, Z9000, and MXL. |
| 9.4.(0.0) | Added support for VRF.                                                                 |

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 9.2(1.0)                       | Introduced on the Z9500.                                                                            |
| 9.0.2.0                        | Introduced on the S6000.                                                                            |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0                       | Introduced on the S4820T.                                                                           |
| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 8.4.1.0                        | Added support for IPv6.                                                                             |
| 7.6.1.0                        | Introduced on the S-Series.                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Usage Information**

Multiple logging servers of both IPv4 and/or IPv6 can be configured.

**Related Commands**

[logging on](#) — enables the logging asynchronously to logging buffer, console, Syslog server, and terminal lines.

[logging trap](#) — enables logging to the Syslog server based on severity.

## logging buffered

Enable logging and specify which messages are logged to an internal buffer. By default, all messages are logged to the internal buffer.

**Syntax**

`logging buffered [level] [size]`

To return to the default values, use the `default logging buffered` command.

To disable logging stored to an internal buffer, use the `no logging buffered` command.

**Parameters**

- level** (OPTIONAL) Indicate a value from 0 to 7 or enter one of the following equivalent words: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is **7** or **debugging**.
- size** (OPTIONAL) Indicate the size, in bytes, of the logging buffer. The number of messages buffered depends on the size of each message. The range is from 40960 to 524288. The default is **40960 bytes**.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 7.6.1.0  | Introduced on the S-Series.                                                                         |
| 7.5.1.0  | Introduced on the C-Series.                                                                         |

**E-Series legacy command**

|                          |                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | When you decrease the buffer size, all messages stored in the buffer are lost. Increasing the buffer size does not affect messages stored in the buffer.                                                                                                                                           |
| <b>Related Commands</b>  | <p><a href="#">clear logging</a> — clears the logging buffer.</p> <p><a href="#">default logging buffered</a> — returns the logging buffered parameters to the default setting.</p> <p><a href="#">show logging</a> — displays the logging setting and system messages in the internal buffer.</p> |

## logging extended

Logs security and audit events to a system log server.

|                      |                  |
|----------------------|------------------|
| <b>Syntax</b>        | logging extended |
| <b>Defaults</b>      | none             |
| <b>Command Modes</b> | CONFIGURATION    |

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                             |
|----------|---------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                             |
| 9.5(0.0) | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

## Usage Information

This command is available with or without RBAC enabled. When RBAC is enabled you can restrict access to audit and security logs based on the CLI sessions' user roles. If extended logging is disabled, you can only view system events, regardless of RBAC user role.

When you enabled RBAC and extended logging:

- Only the system administrator role can execute this command.
- The system administrator and system security administrator roles can view security events and system events.
- The system administrator role can view audit, security, and system events.
- The network administrator and network operator roles can view system events.

## Examples

```
Dell(conf)#logging extended
```

## Related Commands

[show logging auditlog](#) — displays audit log, [clear logging auditlog](#) — clears audit log

## logging console

Specify which messages are logged to the console.

### Syntax

```
logging console [level]
```

To return to the default values, use the default `logging console` command.

To disable logging to the console, use the `no logging console` command.

### Parameters

*level*

(OPTIONAL) Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is **7** or **debugging**.

### Defaults

level = **7**; size = **debugging**

| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

## Related Commands

[clear logging](#) — clears the logging buffer.

[default logging console](#) — returns the logging console parameters to the default setting.

[show logging](#) — displays the logging setting and system messages in the internal buffer.

## logging facility

Configure the Syslog facility used for error messages sent to Syslog servers.

### Syntax

```
logging facility [facility-type]
```

To return to the default values, use the `no logging facility` command.

### Parameters

#### *facility-type*

(OPTIONAL) Enter one of the following parameters:

- `auth` (authorization system)
- `cron` (Cron/at facility)
- `daemon` (system daemons)
- `kern` (kernel)
- `local0` (local use)
- `local1` (local use)
- `local2` (local use)

- local13 (local use)
- local14 (local use)
- local15 (local use)
- local16 (local use)
- local17 (local use)
- lpr (line printer system)
- mail (mail system)
- news (USENET news)
- sys9 (system use)
- sys10 (system use)
- sys11 (system use)
- sys12 (system use)
- sys13 (system use)
- sys14 (system use)
- syslog (Syslog process)
- user (user process)
- uucp (Unix to Unix copy process)

The default is **local7**.

**Defaults**

**local7**

## logging history size

Specify the number of messages stored in the Dell Networking logging history table.

**Syntax** `logging history size size`  
To return to the default values, use the `no logging history size` command.

**Parameters** `size` Indicate a value as the number of messages to be stored. The range is from 0 to 500. The default is **1 message**.

**Defaults** **1 message**

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

### E-Series legacy command

**Usage Information** When the number of messages reach the limit you set with the `logging history size` command, older messages are deleted as newer ones are added to the table.

**Related Commands** [show logging](#) — displays information logged to the history buffer.

## logging monitor

Specify which messages are logged to Telnet applications.

**Syntax** `logging monitor [level]`  
To disable logging to terminal connections, use the `no logging monitor` command.

| <b>Parameters</b>       | <b><i>level</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Indicate a value from 0 to 7 or enter one of the following parameters: <i>emergencies</i> , <i>alerts</i> , <i>critical</i> , <i>errors</i> , <i>warnings</i> , <i>notifications</i> , <i>informational</i> , or <i>debugging</i> . The default is <b>7</b> or <b>debugging</b> . |         |             |          |                             |          |                                                                                                     |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

| 7.6.1.0                 | Introduced on the S-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                   |         |             |          |                             |          |                                                                                                     |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |
| 7.5.1.0                 | Introduced on the C-Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                   |         |             |          |                             |          |                                                                                                     |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |
| <b>Related Commands</b> | <a href="#">default logging monitor</a> — returns the logging monitor parameters to the default setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                   |         |             |          |                             |          |                                                                                                     |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |

## logging on

Specify that debug or error messages are asynchronously logged to multiple destinations, such as the logging buffer, Syslog server, or terminal lines.

|                 |                                                                                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>   | <pre>logging on</pre> <p>To disable logging to logging buffer, Syslog server and terminal lines, use the <code>no logging on</code> command.</p> |
| <b>Defaults</b> | Enabled.                                                                                                                                         |

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**E-Series legacy command**

**Usage Information**

When you use the `no logging on` command, messages are logged only to the console.

**Related Commands**

[logging](#) — enables logging to the Syslog server.

[logging buffered](#) — sets the logging buffered parameters.

[logging console](#) — sets the logging console parameters.

[logging monitor](#) — sets the logging parameters for the terminal connections.

## logging source-interface

Specify that the IP address of an interface is the source IP address of Syslog packets sent to the Syslog server.

**Syntax**

```
logging source-interface interface
```

To disable this command and return to the default setting, use the `no logging source-interface` command.

**Parameters**

***interface***

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For the Management interface on the stack-unit, enter the keyword `ManagementEthernet` then the slot/port information. The slot range is from 0 to 1. The port range is 0.
- For a port channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a Null interface, enter the keyword `null` then the Null interface number.
- For a VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                                |
| 7.6.1.0  | Introduced on the S-Series.                                                                         |
| 7.5.1.0  | Introduced on the C-Series.                                                                         |

**E-Series legacy command**

**Usage Information** Syslog messages contain the IP address of the interface used to egress the router. By configuring the `logging source-interface` command, the Syslog packets contain the IP address of the interface configured.

**Related Commands** [logging](#) — enables logging to the Syslog server.

## logging synchronous

Synchronize unsolicited messages and Dell Networking OS output.

**Syntax** `logging synchronous [level level | all] [limit number-of-buffers]`  
To disable message synchronization, use the `no logging synchronous [level level | all] [limit number-of-buffers]` command.

**Parameters**

|                                       |                                                                                                                                                                                             |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>all</b>                            | Enter the keyword <code>all</code> to ensure that all levels are printed asynchronously.                                                                                                    |
| <b>level <i>level</i></b>             | Enter the keyword <code>level</code> then a number as the severity level. A high number indicates a low severity level and vice versa. The range is from 0 to 7. The default is <b>2</b> .  |
| <b>all</b>                            | Enter the keyword <code>all</code> to turn off all.                                                                                                                                         |
| <b>limit <i>number-of-buffers</i></b> | Enter the keyword <code>limit</code> then the number of buffers to be queued for the terminal after which new messages are dropped. The range is from 20 to 300. The default is <b>20</b> . |

**Defaults** Disabled. If enabled without the `level` or `number-of-buffers` options specified, `level = 2` and `number-of-buffers = 20` are the defaults.

| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

**E-Series legacy command**

## Usage Information

When you enable `logging synchronous`, unsolicited messages appear between software prompts and outputs. Only the messages with a severity at or below the set level are sent to the console.

If the message queue limit is reached on a terminal line and messages are discarded, a system message appears on that terminal line. Messages may continue to appear on other terminal lines.

## Related Commands

[logging on](#) — enables logging.

## logging trap

Specify which messages are logged to the Syslog server based the message severity.

### Syntax

```
logging trap [level]
```

To return to the default values, use the default `logging trap` command.

To disable logging, use the `no logging trap` command.

### Parameters

*level*

Indicate a value from 0 to 7 or enter one of the following parameters: `emergencies`, `alerts`, `critical`, `errors`, `warnings`, `notifications`, `informational`, or `debugging`. The default is **6** or **informational**.

### Defaults

**6** or **informational**

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                      |
|----------|----------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.      |
| 9.0.2.0  | Introduced on the S6000.         |
| 8.3.19.0 | Introduced on the S4820T.        |
| 8.3.11.1 | Introduced on the Z9000.         |
| 8.3.7.0  | Introduced on the S4810.         |
| 7.6.1.0  | Introduced on the S-Series, S55. |
| 7.5.1.0  | Introduced on the C-Series.      |

|                          | Version                        | Description                                                                                                                                                 |
|--------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>E-Series legacy command</b> |                                                                                                                                                             |
| <b>Usage Information</b> |                                | To block a type of message parameter, set the logging trap level to a lower number. For example, to block severity messages at level 6, set the level to 5. |

| <b>9.5(0.0)</b>        | Introduced on the S4810, S4820T, S6000, Z9000, and MXL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |                 |                             |                 |                                                         |

**Usage Information** To display syslog messages in a RFC 3164 or RFC 5424 format, use the **log version** command in configuration mode. By default, the system log version is set to **0**.

The following describes the two supported log messages formats:

- 0 – Displays syslog messages format as described in RFC 3164, The BSD syslog Protocol
- 1 – Displays SYSLOG message format as described in RFC 5424, The Syslog Protocol

**Example**

```
Dell(conf)#logging version ?
<0-1> Select syslog version (default = 0)
Dell(conf)#logging version 1
```

## show logging

Display the logging settings and system messages logged to the internal buffer of the switch.

**Syntax** `show logging [number | history [reverse][number] | reverse [number] | summary]`

**Parameters**

|                |                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>number</b>  | (OPTIONAL) Enter the number of messages displayed in the output. The range is from 1 to 65535.                                                            |
| <b>history</b> | (OPTIONAL) Enter the keyword <code>history</code> to view only information in the Syslog history table.                                                   |
| <b>reverse</b> | (OPTIONAL) Enter the keyword <code>reverse</code> to view the Syslog messages in FIFO (first in, first out) order.                                        |
| <b>summary</b> | (OPTIONAL) Enter the keyword <code>summary</code> to view a table showing the number of messages per type and per slot. Slots *7* and *8* represent RPMs. |

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version                        | Description                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0)                       | Introduced on the S6000-ON.                                                                         |
| 9.2(0.0)                       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0                        | Introduced on the S6000.                                                                            |
| 8.3.19.0                       | Introduced on the S4820T.                                                                           |
| 8.3.11.1                       | Introduced on the Z9000.                                                                            |
| 8.3.7.0                        | Introduced on the S4810.                                                                            |
| 7.6.1.0                        | Introduced on the S-Series.                                                                         |
| 7.5.1.0                        | Introduced on the C-Series.                                                                         |
| <b>E-Series legacy command</b> |                                                                                                     |

**Example (Partial)**

```
Dell#show logging
Syslog logging: enabled
  Console logging: level debugging
  Monitor logging: level debugging
  Buffer logging: level debugging, 5604 Messages Logged,
```

```

Dell#

```

## show logging auditlog

Displays an audit log.

**Syntax**            show logging auditlog

**Defaults**        none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                             |
|----------|---------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                             |
| 9.5(0.0) | Introduced on the S4810, S4820T, S6000, Z9000, and MXL. |

**Example** Dell(conf)#show logging audit

**Related Commands** [clear logging auditlog](#) – clears audit log.

## show logging driverlog stack-unit

Display the driver log for the specified stack member.

**Syntax** show logging driverlog stack-unit *stack-unit-number*

**Parameters**

|                                               |                                                                                                                                  |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit</b><br><b>stack-unit-number</b> | Enter the keywords <i>stack-unit</i> followed by the stack member ID of the switch for which you want to display the driver log. |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|

**defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |

| Version | Description                 |
|---------|-----------------------------|
| 8.3.7.0 | Introduced on the S4810.    |
| 7.6.1.0 | Introduced on the S-Series. |

**Usage Information** This command displays internal software driver information, which may be useful during troubleshooting switch initialization errors, such as a downed Port-Pipe.

## terminal monitor

Configure the Dell Networking OS to display messages on the monitor/terminal.

**Syntax** `terminal monitor`  
To return to default settings, use the `terminal no monitor` command.

**defaults** Disabled.

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 7.6.1.0  | Introduced on the S-Series.                                                                         |
| 7.5.1.0  | Introduced on the C-Series.                                                                         |

**E-Series legacy command**

**Related Commands** [logging monitor](#) — sets the logging parameters on the monitor/terminal.

## SNMP Traps

This chapter lists the traps sent by the Dell Networking operating software. Each trap is listed by the fields Message ID, Trap Type, and Trap Option.

| Message ID                                                                                                                               | Trap Type | Trap Option |
|------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------|
| COLD_START<br>%SNMP-5-SNMP_COLD_START: SNMP COLD_START trap sent.                                                                        | SNMP      | COLDSTART   |
| WARM_START                                                                                                                               | SNMP      | WARMSTART   |
| COPY_CONFIG_COMPLETE<br>SNMP Copy Config Command Completed                                                                               | SNMP      | NONE        |
| LINK_DOWN<br>%IFA-1-PORT_LINKDN: changed interface state to down:%d                                                                      | SNMP      | LINKDOWN    |
| LINK_UP<br>%IFA-1-PORT_LINKUP: changed interface state to up:%d                                                                          | SNMP      | LINKUP      |
| AUTHENTICATION_FAIL<br>%SNMP-3-SNMP_AUTH_FAIL: SNMP Authentication failed.Request with invalid community string.                         | SNMP      | AUTH        |

# Stacking

All commands in this chapter are specific to the Dell Networking operating software.

You can use the commands to pre-configure a switch, so that the configuration settings are invoked when the switch is attached to other S-Series units.

For information about using the S-Series stacking feature, refer to the “Stacking S-Series Switches” chapter in the *Dell Networking OS Configuration Guide*.

 **CAUTION: You cannot enable stacking simultaneously with virtual link trunking (VLT). If you enable both at the same time, unexpected behavior occurs.**

The Dell Networking OS commands for data center bridging features include 802.1Qbb priority-based flow control (PFC), 802.1Qaz enhanced transmission selection (ETS), and the data center bridging exchange (DCBX) protocol.

## Switch Stacking and DCB Caveats for the S4820T

The following is a list of behaviors and limitations regarding the use of DCB over S4820T ports involved in switch stacking:

- You can enable DCB only on 40Gig (QSPF+) ports.
- DCB is not supported over any of the 48 RJ-45 10Gig ports while they are configured in Stacking mode.
- You cannot configure stacking on any of the 48 RJ-45 10Gig ports if you enable DCB on any of the 40Gig stacking ports.
- If you enable DCB, it disables the ability to use any of the 48 10Gig ports for stacking.

## redundancy disable-auto-reboot

Prevent the S-Series stack management unit, stack member unit, and standby unit from rebooting if they fail.

**Syntax**                    `redundancy disable-auto-reboot stack-unit [members | 0-11]`  
To return to the default, use the `no redundancy disable-auto-reboot stack-unit` command.

| <b>Parameters</b>        | <p><b>stack-unit</b>      Enter the stack-unit number. For the S4820T, the range is from 0 to 11.</p> <p><b>members</b>      Enter the keyword members for all stack-units.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |         |             |          |                          |          |                           |         |                          |          |                          |         |                                        |

| 8.3.7.0                  | Introduced on the S4810.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                          |          |                           |         |                          |          |                          |         |                                        |
| 8.3.11.1                 | Introduced on the Z9000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                          |          |                           |         |                          |          |                          |         |                                        |
| 8.3.1.0                  | Added the <code>members</code> option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |          |                          |          |                           |         |                          |          |                          |         |                                        |
| <b>Usage Information</b> | Enabling this command keeps the failed switch in the Failed state. The switch does not reboot until it is manually rebooted. When enabled, it is not displayed in the running-config. When disabled, it is displayed in the running-config.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |             |          |                          |          |                           |         |                          |          |                          |         |                                        |
| <b>Related Commands</b>  | <a href="#">show redundancy</a> — displays the current redundancy status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                          |          |                           |         |                          |          |                          |         |                                        |

## redundancy force-failover stack-unit

Force the standby unit in the stack to become the management unit.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>redundancy force-failover stack-unit</code>                                                                                                              |
| <b>Parameters</b>      | <p><b>stack-unit</b>      Enter the stack unit. For the S4820T, the range is from 0 to 11.</p>                                                                 |
| <b>Defaults</b>        | Not enabled.                                                                                                                                                   |
| <b>Command Modes</b>   | EXEC Privilege                                                                                                                                                 |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                            |
|----------|----------------------------------------|
| 9.7(0.0) | Introduced on the S6000.               |
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.7.0  | Introduced on the S4810.               |
| 8.3.11.1 | Introduced on the Z9000.               |
| 8.3.1.0  | Added the <code>members</code> option. |

## redundancy protocol

Enable hitless failover for a protocol.

**Syntax** `redundancy protocol`

### Protocols

|             |                                                              |
|-------------|--------------------------------------------------------------|
| <b>lacp</b> | Enter the LACP protocol                                      |
| <b>xstp</b> | Enter one of the following protocols: STP, RSTP, MSTP, PVST. |

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                            |
|----------|----------------------------------------|
| 9.7(0.0) | Introduced on the S6000.               |
| 8.3.19.0 | Introduced on the S4820T.              |
| 8.3.7.0  | Introduced on the S4810.               |
| 8.3.11.1 | Introduced on the Z9000.               |
| 8.3.1.0  | Added the <code>members</code> option. |

# reset stack-unit

Reset any designated stack member except the management unit (master unit).

**Syntax** `reset stack-unit hard`

**Parameters**

- stack-unit** Enter the stack-unit number. The range is from 0 to 11.
- hard** Reset the stack unit if the unit is in a problem state.

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                               |
|----------|-------------------------------------------|
| 9.7(0.0) | Introduced on the S6000.                  |
| 8.3.19.0 | Introduced on the S4820T.                 |
| 8.3.7.0  | Introduced on the S4810.                  |
| 8.3.11.1 | Introduced on the Z9000.                  |
| 8.3.1.0  | Added the <code>hard reset</code> option. |

**Usage Information** Resetting the management unit is not allowed, and an error message displays if you try to do so. Resetting is a soft reboot, including flushing the forwarding tables.

Starting with Dell Networking OS version 7.8.1.0, you can run this command directly on the stack standby unit (standby master) to reset the standby. You cannot reset any other unit from the standby unit.

## Example

```
Stack MAC : 00:01:e8:8b:1a:36
Reload-Type : normal-reload [Next boot : normal-reload]
-- Stack Info --
Unit UnitType Status ReqTyp CurTyp Version Ports
-----
0 Management online S4810 S4810 8-3-12-1 64
1 Standby online S4810 S4810 8-3-12-1 64
2 Member online S4810 S4810 8-3-12-1 64
3 Member online S4810 S4810 8-3-12-1 64
4 Member online S4810 S4810 8-3-12-1 64
5 Member online S4810 S4810 8-3-12-1 64

11 Member not present
```

**Related  
Commands**

- [reload](#) – reboots Dell Networking OS.

## show redundancy

Display the current redundancy configuration (status of automatic reboot configuration on stack management unit).

**Syntax** `show redundancy`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.7(0.0) | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information** To modify your results, use the `show redundancy [pipe]` command, as follows:

- `except` – show only text that doesn't match a pattern.
- `find` – search for the first occurrence of a pattern.
- `grep` – show only text that matches a pattern.
- `no-more` – do not paginate the output.
- `save` – save the output to a file.

**Example**

```
Dell#show redundancy

Dell#

```

## show system stack-ports

Display information about the stacking ports on all switches in the stack.

|                        |                                                                                                                                                                |                                                                                                                    |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show system stack-ports [status   topology]</code>                                                                                                       |                                                                                                                    |
| <b>Parameters</b>      | <b>status</b>                                                                                                                                                  | (OPTIONAL) Enter the keyword <code>status</code> to display the command output without the Connection field.       |
|                        | <b>topology</b>                                                                                                                                                | (OPTIONAL) Enter the keyword <code>topology</code> to limit the table to just the Interface and Connection fields. |
| <b>Defaults</b>        | none                                                                                                                                                           |                                                                                                                    |
| <b>Command Modes</b>   | <ul style="list-style-type: none"> <li>EXEC</li> <li>EXEC Privilege</li> </ul>                                                                                 |                                                                                                                    |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                    |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.7(0.0) | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage Information**

The following describes the `show system stack-ports` command shown in the following example.

| Field               | Description                                                                    |
|---------------------|--------------------------------------------------------------------------------|
| <b>Topology</b>     | Lists the topology of stack ports connected: Ring, Daisy chain, or Standalone. |
| <b>Interface</b>    | The unit/port ID of the connected stack port on this unit.                     |
| <b>Link Speed</b>   | Link Speed of the stack port (10 or 40) in Gb/s.                               |
| <b>Admin Status</b> | The only currently listed status is Up.                                        |
| <b>Connection</b>   | The stack port ID to which this unit's stack port is connected.                |

**Example**

```
Dell# show system stack-ports
Topology: Ring
Interface Connection Link Speed Admin Link
              (Gb/s)  Status Status
-----
0/49         1/49         12      up      up
0/50         1/49         12      up      down
0/51         2/49         24      up      up
1/49         0/49         12      up      up
1/50         2/51         12      up      up
2/49         0/51         24      up      up
2/51         1/50         12      up      up
2/52         1/50         12      up      down
Dell#
```

```
Dell# show system stack-ports
Topology: Ring
Interface Connection Link Speed Admin Link
              (Gb/s)  Status Status
-----
1/49         2/49         12      up      up
1/50         1/49         12      up      down
1/51         3/49         24      up      up
2/49         1/49         12      up      up
2/50         3/51         12      up      up
3/49         1/51         24      up      up
3/51         2/50         12      up      up
3/52         1/51         12      up      down
Dell#
```

**Example (Status)**

```
Dell# show system stack-ports status
Topology: Ring
Interface Link Speed Admin Link
              (Gb/s)  Status Status
-----
```

```

0/49          12      up      up
0/50          12      up      down
0/51          24      up      up
1/49          12      up      up
1/50          12      up      up
2/49          24      up      up
2/51          12      up      up
2/52          12      up      down
Dell#

```

### Example (Topology)

```
Dell# show system stack-ports topology
```

```
Topology: Ring
```

```
Interface Connection
```

```
-----
0/49          1/49
0/50
0/51          2/49
1/49          0/49
1/50          2/51
2/49          0/51
2/51          1/50
2/52
Dell#
```

### Related Commands

- [reset stack-unit](#) – resets the designated stack member.
- [show hardware stack-unit](#) – displays the data plane or management plane input and output statistics of the designated component of the designated stack member.
- [show system \(S-Series and Z-Series\)](#) – displays the current status of all stack members or a specific member.

## stack-unit priority

Configure the ability of a switch to become the management unit of a stack.

**Syntax** `stack-unit stack-unit number priority 1-14`

### Parameters

|                            |                                                                                                                                                                                                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>stack-number</i></b> | Enter the stack member unit identifier.                                                                                                                                                                                                                                                                 |
| <b><i>1-14</i></b>         | This preference parameter allows you to specify the management priority of one backup switch over another, with 0 the lowest priority and 14 the highest. The switch with the highest priority value is chosen to become the management unit if the active management unit fails or on the next reload. |

**Defaults** 0

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.7(0.0) | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Related Commands**

- [reload](#) – reboots Dell Networking OS.

## stack-unit provision

Preconfigure a logical stacking ID of a switch that joins the stack. This is an optional command that is executed on the management unit.

**Syntax** `stack-unit [stack-number] provision {S4810|S4820T|S6000|Z9000}`

**Parameters**

|                                 |                                                                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>stack-unit</b>               | Enter a stack member identifier of the switch that you want to add to the stack.                                                           |
| <b>S4810 S4820T S6000 Z9000</b> | Enter the model identifier of the switch to be added as a stack member. This identifier is also referred to as the <i>provision type</i> . |

**Defaults**

When this value is not set, a switch joining the stack is given the next available sequential stack member identifier.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description              |
|----------|--------------------------|
| 9.7(0.0) | Introduced on the S6000. |

| Version  | Description               |
|----------|---------------------------|
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Related Commands**

- [reload](#) – reboots Dell Networking OS.
- [show system \(S-Series and Z-Series\)](#) – displays the status of all stack members or a specific member.

## stack-unit stack-group

Configure the stacking unit and stacking group by specifying an ID when adding units to a stack to ensure the unit is assigned to the correct group.

**Syntax**

`stack-unit unit-id stack-group stack-group-id`

To remove the current stack group configuration, use the `no stack-unit unit-id stack-group stack-id` command.

**Parameters**

- unit-id** Enter the stack unit ID.
- stack-group-id** Enter the stack group ID. The range is from 0 to 15.

**Defaults**

none

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                    |
|----------|------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000.                       |
| 8.3.19.0 | Introduced on the S4820T.                      |
| 8.3.7.1  | Introduced on the S4810.                       |
| 8.3.12.0 | Reset command mode from EXEC to CONFIGURATION. |

**Usage Information**

The following message displays to confirm the command.

```
Setting ports Fo 1/60 as stack group will make their interface
configs obsolete after a reload.[confirm yes/no]: If "y" is
entered, all non-default configurations on any member ports of
```

the current stack group will be removed when the unit is rebooted.

**NOTE:** Any scripts used to streamline the stacking configuration process must be updated to reflect the Command Mode change from EXEC Privilege to CONFIGURATION to allow the scripts to work correctly.

## upgrade system stack-unit

Copy the boot image or Dell Networking OS from the management unit to one or more stack members.

**Syntax** `upgrade {boot | system} stack-unit {all | stack-unit-number | A | B}`

### Parameters

|                   |                                                                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>boot</b>       | Enter the keyword <code>boot</code> to copy the boot image from the management unit to the designated stack members.                 |
| <b>system</b>     | Enter the keyword <code>system</code> to copy the Dell Networking OS image from the management unit to the designated stack members. |
| <b>stack-unit</b> | Enter the stack-unit number. For the S4810, the range is from 0 to 11.                                                               |
| <b>all</b>        | Enter the keyword <code>all</code> to copy the designated image to all stack members.                                                |
| <b>A</b>          | Enter the keyword <code>A</code> to upgrade all stacked units in System A ( S4820T only).                                            |
| <b>B</b>          | Enter the keyword <code>B</code> to upgrade all stacked units in System B ( S4820T only).                                            |

**Defaults** none

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description               |
|----------|---------------------------|
| 9.7(0.0) | Introduced on the S6000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.7.0  | Introduced on the S4810.  |
| 8.3.11.1 | Introduced on the Z9000.  |

**Usage  
Information**

To reboot using the new image, use the `upgrade boot system stack-unit` command.

**Related  
Commands**

- [reload](#) — reboots Dell Networking OS.
- [reset stack-unit](#) — resets the designated stack member.
- [show system \(S-Series and Z-Series\)](#) — displays the status of all stack members or a specific member.
- [show version](#) — displays the current Dell Networking OS version information on the system.
- [upgrade \(S-Series management unit and Z-Series\)](#) — upgrades the bootflash image or system image of the S-Series management unit.

# Storm Control

The Dell Networking operating software storm control feature allows you to limit or suppress traffic during a traffic storm (Broadcast/Unknown Unicast Rate Limiting or Multicast on the C-Series and S-Series).

Storm control is supported on Dell Networking OS.

## Important Points to Remember

- Interface commands can only be applied on physical interfaces (virtual local area networks [VLANs] and link aggregation group [LAG] interfaces are not supported).
  - An INTERFACE-level command only supports storm control configuration on ingress.
  - An INTERFACE-level command overrides any CONFIGURATION-level ingress command for that physical interface, if both are configured.
  - You can apply the CONFIGURATION-level storm control commands at ingress or egress and are supported on all physical interfaces.
  - When storm control is applied on an interface, the percentage of storm control applied is calculated based on the advertised rate of the line card. It is not based on the speed setting for the line card.
  - Do not apply per-VLAN quality of service (QoS) on an interface that has storm control enabled (either on an interface or globally).
  - When you enable broadcast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 1 is configured for the data traffic, the traffic goes to queue 1 instead of queue 0.
  - Similarly, if you enable unicast storm control on an interface or globally on ingress, and DSCP marking for a DSCP value 2 is configured for the data traffic, the traffic goes to queue 2 instead of queue 0.
-  **NOTE:** Bi-directional traffic (unknown unicast and broadcast) along with egress storm control causes the configured traffic rates split between the involved ports. The percentage of traffic that each port receives after the split is not predictable. These ports can be in the same/different port pipes or the same/different line cards.
-  **NOTE:** The policy discard drop counters are common across storm-control drops, ACL drops and QoS drops. Therefore, if your configuration includes ACL and QoS, those drops are also computed and displayed in the policy discard drops counter field along with storm-control drops. The packets dropped by the storm control feature can be monitored by viewing the value of the Policy Discard Drops field of the output of the `show hardware stack-unit stack-unit-number drops` command.

## show storm-control broadcast

Display the storm control broadcast configuration.

|                        |                                                                                                                                                                |                                                                                                                                                                                                                                                                                          |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>show storm-control broadcast [<i>interface</i>]</code>                                                                                                   |                                                                                                                                                                                                                                                                                          |

| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                                                                                                                                                                                                          |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.5.1.0  | Introduced on the E-Series.                          |

## show storm-control multicast

Display the storm control multicast configuration.

|               |                                                              |
|---------------|--------------------------------------------------------------|
| <b>Syntax</b> | <code>show storm-control multicast [<i>interface</i>]</code> |
|---------------|--------------------------------------------------------------|

**Parameters*****interface***

(OPTIONAL) Enter one of the following interfaces to display the interface specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults**

none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                          |
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.19.0 | Introduced on the S4820T.                            |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 8.3.7.0  | Introduced on the S4810.                             |
| 7.6.1.0  | Introduced on the C-Series and S-Series.             |

**Example**

```
Dell#show storm-control multicast Tengigabitethernet 1/1
Multicast storm control configuration
Interface  Direction      Packets/Second
-----
Te 1/1      Ingress          5
Dell#
```

# show storm-control unknown-unicast

Display the storm control unknown-unicast configuration.

**Syntax** `show storm-control unknown-unicast [interface]`

**Parameters**

**interface** (OPTIONAL) Enter one of the following interfaces to display the interface specific storm control configuration:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a port channel interface, enter the keywords `port-channel` then a number.

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale.                                                |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 7.6.1.0  | Introduced on the S-Series.                                                                         |
| 7.5.1.0  | Introduced on the C-Series.                                                                         |
| 6.5.1.0  | Introduced on the E-Series.                                                                         |

# storm-control broadcast (Configuration)

Configure the percentage of broadcast traffic allowed in the network.

**Syntax** `storm-control broadcast [packets_per_second in]`  
To disable broadcast rate-limiting, use the `no storm-control broadcast [packets_per_second in]` command.

**Parameters**

|                                          |                                                                                                                                                                                               |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>percentage decimal value in   out</b> | Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%. The decimal range is from .1 to .9. |
| <b>wred-profile name</b>                 | Enter the keyword <b>wred-profile</b> followed by the profile name to designate a wred-profile.                                                                                               |
| <b>packets_per_second in</b>             | Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368.                                                                                  |

**Defaults** none

**Command Modes** CONFIGURATION (conf)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 7.6.1.0  | Introduced on the S-Series.                                                                         |
| 7.5.1.0  | Introduced on the C-Series.                                                                         |
| 7.4.1.0  | E-Series Only: Added the percentage decimal value option.                                           |
| 6.5.1.0  | Introduced on the E-Series.                                                                         |

**Usage Information** Broadcast storm control is valid on Layer 2/Layer 3 interfaces only. Layer 2 broadcast traffic is treated as unknown-unicast traffic.

## storm-control broadcast (Interface)

Configure the percentage of broadcast traffic allowed on an interface (ingress only).

**Syntax** `storm-control broadcast [packets_per_second in]`  
To disable broadcast storm control on the interface, use the `no storm-control broadcast [packets_per_second in]` command.

**Parameters**

|                              |                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>packets_per_second in</b> | Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368. |
|------------------------------|--------------------------------------------------------------------------------------------------------------|

**Defaults** none

**Command Modes** INTERFACE (conf-if-interface-slot/port)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                               |
|----------|-----------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                               |
| 9.0.2.0  | Introduced on the S6000.                                  |
| 8.3.19.0 | Introduced on the S4820T.                                 |
| 8.3.11.1 | Introduced on the Z9000.                                  |
| 8.3.7.0  | Introduced on the S4810.                                  |
| 7.6.1.0  | Introduced on the S-Series.                               |
| 7.5.1.0  | Introduced on the C-Series.                               |
| 7.4.1.0  | E-Series Only: Added the percentage decimal value option. |
| 6.5.1.0  | Introduced on the E-Series.                               |

## storm-control multicast (Configuration)

Configure the packets per second (pps) of multicast traffic allowed into the C-Series and S-Series networks only.

**Syntax** `storm-control multicast packets_per_second in`

To disable storm-control for multicast traffic into the network, use the `no storm-control multicast packets_per_second` in command.

**Parameters**                      `packets_per_second in`                      Enter the packets per second of multicast traffic allowed into the network. The range is from 0 to 33554368.

**Defaults**                                      none

**Command Modes**                              CONFIGURATION (conf)

**Command History**                              This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.11.1 | Introduced on the Z9000.                                                                            |
| 8.3.7.0  | Introduced on the S4810.                                                                            |
| 7.6.1.0  | Introduced on the C-series and S-Series.                                                            |

**Usage Information**                              Broadcast traffic (all 0xFs) should be counted against the broadcast storm control meter, not against the multicast storm control meter. It is possible, however, that some multicast control traffic may get dropped when storm control thresholds are exceeded.

## storm-control multicast (Interface)

Configure the percentage of multicast traffic allowed on an C-Series or S-Series interface (ingress only) network only.

**Syntax**                                      `storm-control multicast packets_per_second in`  
To disable multicast storm control on the interface, use the `no storm-control multicast packets_per_second` in command.

|                        |                                                                                                                                                                |                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b><i>packets_per_second in</i></b>                                                                                                                            | Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368. |
| <b>Defaults</b>        | none                                                                                                                                                           |                                                                                                              |
| <b>Command Modes</b>   | INTERFACE (conf-if- <i>interface-slot/port</i> )                                                                                                               |                                                                                                              |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                              |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 7.6.1.0  | Introduced on the C-series and S-Series. |

## storm-control unknown-unicast (Configuration)

Configure the percentage of unknown-unicast traffic allowed in or out of the network.

|               |                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b> | <code>storm-control unknown-unicast [<i>packets_per_second in</i>]</code><br>To disable storm control for unknown-unicast traffic, use the <code>no storm-control unknown-unicast [<i>packets_per_second in</i>]</code> command. |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                        |                                                                                                                                                                |                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b><i>packets_per_second in</i></b>                                                                                                                            | Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554368. |
| <b>Defaults</b>        | none                                                                                                                                                           |                                                                                                              |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                  |                                                                                                              |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                                              |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                            |
|----------|------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                            |
| 9.0.2.0  | Introduced on the S6000.                                               |
| 8.3.19.0 | Introduced on the S4820T.                                              |
| 8.3.11.1 | Introduced on the Z9000.                                               |
| 8.3.7.0  | Introduced on the S4810.                                               |
| 7.6.1.0  | Introduced on the S-Series.                                            |
| 7.5.1.0  | Introduced on the C-Series.                                            |
| 7.4.1.0  | E-Series Only: Added the <code>percentage decimal value</code> option. |
| 6.5.1.0  | Introduced on the E-Series.                                            |

#### Usage Information

Unknown Unicast Storm-Control is valid for Layer 2 and Layer 2/Layer 3 interfaces.

## storm-control unknown-unicast (Interface)

Configure percentage of unknown-unicast traffic allowed on an interface (ingress only).

#### Syntax

```
storm-control unknown-unicast [percentage decimal_value in] |
[wred-profile name]] [packets_per_second in]
```

To disable unknown-unicast storm control on the interface, use the `no storm-control unknown-unicast [percentage decimal_value in] | [wred-profile name]] [packets_per_second in]` command.

#### Parameters

***percentage decimal\_value***  
[in | out]

E-Series Only: Enter the percentage of broadcast traffic allowed in or out of the network. Optionally, you can designate a decimal value percentage, for example, 55.5%.

The percentage is from 0 to 100:

- 0% blocks all related traffic.
- 100% allows all traffic into the interface.

The decimal range is from 0.1 to 0.9.

**wred-profile name**

E-Series Only: (Optionally) Enter the keywords `wred-profile` followed by the profile name to designate a wred-profile.

**packets\_per\_second in** C-Series and S-Series Only: Enter the packets per second of broadcast traffic allowed into the network. The range is from 0 to 33554431.

**Defaults** none

**Command Modes** INTERFACE (conf-if-*interface-slot/port*)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b> | <b>Description</b>                                        |
|----------------|-----------------------------------------------------------|
| 9.7(0.0)       | Introduced on the S6000-ON.                               |
| 9.0.2.0        | Introduced on the S6000.                                  |
| 8.3.19.0       | Introduced on the S4820T.                                 |
| 8.3.11.1       | Introduced on the Z9000.                                  |
| 8.3.7.0        | Introduced on the S4810.                                  |
| 7.6.1.0        | Introduced on the S-Series.                               |
| 7.5.1.0        | Introduced on the C-Series.                               |
| 7.4.1.0        | E-Series Only: Added the percentage decimal value option. |
| 6.5.1.0        | Introduced on the E-Series.                               |

# Spanning Tree Protocol (STP)

The commands in this chapter configure and monitor the IEEE 802.1d spanning tree protocol (STP) and are supported on the Dell Networking switch/routing platform.

## bridge-priority

Set the bridge priority of the switch in an IEEE 802.1D spanning tree.

**Syntax** `bridge-priority {priority-value | primary | secondary}`  
To return to the default value, use the `no bridge-priority` command.

**Parameters**

|                              |                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------|
| <b><i>priority-value</i></b> | Enter a number as the bridge priority value. The range is from 0 to 65535. The default is <b>32768</b> . |
| <b>primary</b>               | Enter the keyword <code>primary</code> to designate the bridge as the root bridge.                       |
| <b>secondary</b>             | Enter the keyword <code>secondary</code> to designate the bridge as a secondary root bridge.             |

**Defaults** `priority-value = 32768`

**Command Modes** SPANNING TREE (The prompt is "config-stp".)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |

| Version | Description                 |
|---------|-----------------------------|
| 7.7.1.0 | Introduced on the S-Series. |
| 7.5.1.0 | Introduced on the C-Series. |
| 6.2.1.1 | Introduced on the E-Series. |

## bpdu-destination-mac-address

Use the Provider Bridge Group address in Spanning Tree or GVRP PDUs.

**Syntax** `bpdu-destination-mac-address [stp | gvrp] provider-bridge-group`

| Parameters  |                                                                                                                 |  |
|-------------|-----------------------------------------------------------------------------------------------------------------|--|
| <b>xstp</b> | Force STP, RSTP, and MSTP to use the Provider Bridge Group address as the destination MAC address in its BPDUs. |  |
| <b>gvrp</b> | Forces GVRP to use the Provider Bridge GVRP Address as the destination MAC address in its PDUs.                 |  |

**Defaults** The destination MAC address for BPDUs is the Bridge Group Address.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the S4810.                 |
| 8.2.1.0  | Introduced on the C-Series and S-Series. |

# debug spanning-tree

Enable debugging of the spanning tree protocol and view information on the protocol.

**Syntax** `debug spanning-tree {stp-id [all | bpdu | config | events | exceptions | general | root] | protocol}`  
To disable debugging, use the `no debug spanning-tree` command.

| Parameters |                 |                                                                                                                       |
|------------|-----------------|-----------------------------------------------------------------------------------------------------------------------|
|            | <b>stp-id</b>   | Enter zero (0). The switch supports one spanning tree group with a group ID of 0.                                     |
|            | <b>protocol</b> | Enter the keyword for the type of STP to debug, either <code>mstp</code> , <code>pvst</code> , or <code>rstp</code> . |
|            | <b>all</b>      | (OPTIONAL) Enter the keyword <code>all</code> to debug all spanning tree operations.                                  |
|            | <b>bpdu</b>     | (OPTIONAL) Enter the keyword <code>bpdu</code> to debug bridge protocol data units.                                   |
|            | <b>config</b>   | (OPTIONAL) Enter the keyword <code>config</code> to debug configuration information.                                  |
|            | <b>events</b>   | (OPTIONAL) Enter the keyword <code>events</code> to debug STP events.                                                 |
|            | <b>general</b>  | (OPTIONAL) Enter the keyword <code>general</code> to debug general STP operations.                                    |
|            | <b>root</b>     | (OPTIONAL) Enter the keyword <code>root</code> to debug STP root transactions.                                        |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

When you enable `debug spanning-tree bpd` for multiple interfaces, the software only sends information on BPDUs for the last interface specified.

**Related Commands**

[protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

## description

Enter a description of the spanning tree.

**Syntax**

`description {description}`

To remove the description from the spanning tree, use the `no description {description}` command.

**Parameters**

**description** Enter a description to identify the spanning tree (80 characters maximum).

**Defaults**

none

**Command Modes**

SPANNING TREE (The prompt is "config-stp".)

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced                  |

**Related Commands**

[protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

# disable

Disable the spanning tree protocol globally on the switch.

**Syntax** `disable`  
To enable Spanning Tree Protocol, use the `no disable` command.

**Defaults** Enabled (that is, the spanning tree protocol is disabled.)

**Command Modes** SPANNING TREE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Related Commands** [protocol spanning-tree](#) — enters SPANNING TREE mode on the switch.

# forward-delay

The amount of time the interface waits in the Listening state and the Learning state before transitioning to the Forwarding state.

**Syntax** `forward-delay seconds`  
To return to the default setting, use the `no forward-delay` command.

**Parameters** `seconds` Enter the number of seconds the Dell Networking OS waits before transitioning STP to the Forwarding state. The range is from 4 to 30. The default is **15 seconds**.

| <b>Defaults</b>         | <b>15 seconds</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |          |                             |         |                          |          |                           |          |                          |         |                          |         |                             |         |                             |         |                             |

## hello-time

Set the time interval between generation of the spanning tree bridge protocol data units (BPDUs).

|                        |                                                                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>hello-time seconds</code>                                                                                                                                      |
|                        | To return to the default value, use the <code>no hello-time</code> command.                                                                                          |
| <b>Parameters</b>      | <p><b>seconds</b> Enter a number as the time interval between transmission of BPDUs. The range is from 1 to 10. The default is <b>2 seconds</b>.</p>                 |
| <b>Defaults</b>        | <b>2 seconds</b>                                                                                                                                                     |
| <b>Command Modes</b>   | SPANNING TREE                                                                                                                                                        |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

#### Related Commands

[forward-delay](#) — changes the wait time before STP transitions to the Forwarding state.

[max-age](#) — changes the wait time before STP refreshes protocol configuration information.

## max-age

To maintain configuration information before refreshing that information, set the time interval for the spanning tree bridge.

#### Syntax

`max-age seconds`

To return to the default values, use the `no max-age` command.

#### Parameters

##### **seconds**

Enter a number of seconds the Dell Networking OS waits before refreshing configuration information. The range is from 6 to 40. The default is **20 seconds**.

#### Defaults

**20 seconds**

#### Command Modes

SPANNING TREE

#### Command History

**Related  
Commands**

[forward-delay](#) — changes the wait time before STP transitions to the Forwarding state.

[hello-time](#) — changes the time interval between BPDUs.

## protocol spanning-tree

To enable and configure the spanning tree group, enter SPANNING TREE mode.

**Syntax**

`protocol spanning-tree stp-id`

To disable the Spanning Tree group, use the `no protocol spanning-tree stp-id` command.

**Parameters**

*stp-id*

Enter zero (0). Dell Networking OS supports one spanning tree group, group 0.

**Defaults**

Not configured.

**Command  
Modes**

CONFIGURATION

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** STP is not enabled when you enter SPANNING TREE mode. To enable STP globally on the switch, use the `no disable` command from SPANNING TREE mode.

**Example**

```
Dell(conf)#protocol spanning-tree 0
Dell(config-stp)#
```

**Related Commands** [disable](#) — disables spanning tree group 0. To enable spanning tree group 0, use the `no disable` command.

## show config

Display the current configuration for the mode. Only non-default values display.

**Syntax** `show config`

**Command Modes** SPANNING TREE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.7.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Example**

```
Dell(config-stp)#show config
protocol spanning-tree 0
  no disable
Dell(config-stp)#
```

## show spanning-tree 0

Display the spanning tree group configuration and status of interfaces in the spanning tree group.

**Syntax** `show spanning-tree 0 [active | brief | guard | interface interface | root | summary]`

|                   |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>0</b>                   | Enter 0 (zero) to display information about that specific spanning tree group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                   | <b>active</b>              | (OPTIONAL) Enter the keyword <code>active</code> to display only active interfaces in spanning tree group 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                   | <b>brief</b>               | (OPTIONAL) Enter the keyword <code>brief</code> to display a synopsis of the spanning tree group configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                   | <b>guard</b>               | (OPTIONAL) Enter the keyword <code>guard</code> to display the type of guard enabled on an STP interface and the current port state.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>interface interface</b> | (OPTIONAL) Enter the keyword <code>interface</code> and the type slot/port of the interface you want displayed. Type slot/port options are the following: <ul style="list-style-type: none"> <li>• For a Port Channel interface, enter the keywords <code>port-channel</code> then a number. The range is from 1 to 128.</li> <li>• For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>• For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> </ul> |
|                   | <b>root</b>                | (OPTIONAL) Enter the keyword <code>root</code> to display configuration information on the spanning tree group root.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                   | <b>summary</b>             | (OPTIONAL) Enter the keyword <code>summary</code> to only the number of ports in the spanning tree group and their state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                  |
|----------|--------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                  |
| 9.0.2.0  | Introduced on the S6000.                                                                                     |
| 8.3.19.0 | Introduced on the S4820T.                                                                                    |
| 8.3.11.1 | Introduced on the Z9000.                                                                                     |
| 8.5.1.0  | Added support for 4-port 40G line cards on the E-Series ExaScale.                                            |
| 8.4.2.1  | Added support for the optional <code>guard</code> keyword on the C-Series, S-Series, and E-Series TeraScale. |
| 8.3.7.0  | Introduced on the S4810.                                                                                     |
| 7.7.1.0  | Introduced on the S-Series.                                                                                  |
| 7.5.1.0  | Introduced on the C-Series.                                                                                  |
| 6.2.1.1  | Introduced on the E-Series.                                                                                  |

#### Usage Information

Enable spanning tree group 0 prior to using this command.

The following describes the `show spanning-tree 0` command shown in the example.

| Field                  | Description                                                                                                                                                                   |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "Bridge Identifier..." | Lists the bridge priority and the MAC address for this STP bridge.                                                                                                            |
| "Configured hello..."  | Displays the settings for hello time, max age, and forward delay.                                                                                                             |
| "We are..."            | States whether this bridge is the root bridge for the STG.                                                                                                                    |
| "Current root..."      | Lists the bridge priority and MAC address for the root bridge.                                                                                                                |
| "Topology flag..."     | States whether the topology flag and the detected flag were set.                                                                                                              |
| "Number of..."         | Displays the number of topology changes, the time of the last topology change, and on what interface the topology change occurred.                                            |
| "Timers"               | Lists the values for the following bridge timers: hold time, topology change, hello time, max age, and forward delay.                                                         |
| "Times"                | List the number of seconds since the last: <ul style="list-style-type: none"> <li>• hello time</li> <li>• topology change</li> <li>• notification</li> <li>• aging</li> </ul> |

| Field                | Description                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------|
| "Port 1..."          | Displays the Interface type slot/port information and the status of the interface (Disabled or Enabled). |
| "Port path..."       | Displays the path cost, priority, and identifier for the interface.                                      |
| "Designated root..." | Displays the priority and MAC address of the root bridge of the STG that the interface belongs to.       |
| "Designated port..." | Displays the designated port ID.                                                                         |

### Example

```
Dell#show spann 0

Executing IEEE compatible Spanning Tree Protocol
Bridge Identifier has priority 32768, Address 0001.e800.0a56
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Current root has priority 32768 address 0001.e800.0a56
Topology change flag set, detected flag set
Number of topology changes 1 last change occurred 0:00:05 ago
  from TenGigabitEthernet 1/3
Timers:hold 1, topology change 35
      hello 2, max age 20, forward_delay 15
Times:hello 1, topology change 1, notification 0, aging 2

Port 26 (TenGigabitEthernet 1/1) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.26
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.26, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:18, received 0
The port is not in the portfast mode

Port 27 (TenGigabitEthernet 1/2) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.27
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.27, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:18, received 0
The port is not in the portfast mode

Port 28 (TenGigabitEthernet 1/3) is Forwarding
Port path cost 4, Port priority 8, Port Identifier 8.28
Designated root has priority 32768, address 0001.e800.0a56
Designated bridge has priority 32768, address 0001.e800.0a56
Designated port id is 8.28, designated path cost 0
Timers: message age 0, forward_delay 0, hold 0
Number of transitions to forwarding state 1
BPDU: sent:31, received 0
The port is not in the portfast mode

Dell#

```

### Usage Information

The following describes the show spanning-tree 0 guard command shown in the example.

| Field          | Description                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| Interface Name | STP interface.                                                                                                          |
| Instance       | STP 0 instance.                                                                                                         |
| Sts            | Port state: root-inconsistent (INCON Root), forwarding (FWD), listening (LIS), blocking (BLK), or shut down (EDS Shut). |
| Guard Type     | Type of STP guard configured (Root, Loop, or BPDU guard).                                                               |

### Example (Guard)

```
Dell#show spanning-tree 0 guard
Interface
Name      Instance   Sts           Guard type
-----
Te 1/1    0          INCON(Root)   Rootguard
Te 1/2    0          LIS           Loopguard
Te 1/3    0          EDS (Shut)    Bpduguard
```

## spanning-tree

Assigns a Layer 2 interface to STP instance 0 and configures a port cost or port priority, or enables loop guard, root guard, or the Portfast feature on the interface.

### Syntax

```
spanning-tree stp-id {cost cost | {loopguard | rootguard} |
portfast [bpduguard [shutdown-on-violation]] | priority
priority}
```

To disable Spanning Tree group on an interface, use the no spanning-tree *stp-id* {cost *cost* | {loopguard | rootguard} | portfast [bpduguard [shutdown-on-violation]] | priority *priority*} command.

## Parameters

|                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>stp-id</i></b>                                                             | Enter the STP instance ID. The range is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>cost cost</i></b>                                                          | Enter the keyword <code>cost</code> then a number as the cost. The range is from 1 to 65535. The defaults are: <ul style="list-style-type: none"><li>• 1-Gigabit Ethernet interface = <b>4</b>.</li><li>• 10-Gigabit Ethernet interface = <b>2</b>.</li><li>• Port Channel interface with 100 Mb/s Ethernet = <b>18</b>.</li><li>• Port Channel interface with 1 Gigabit Ethernet = <b>3</b>.</li><li>• Port Channel interface with 10 Gigabit Ethernet = <b>1</b>.</li></ul> |
| <b><i>loopguard</i></b>                                                          | Enter the keyword <code>loopguard</code> to enable STP loop guard on a port or port-channel interface.                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>rootguard</i></b>                                                          | Enter the keyword <code>rootguard</code> to enable STP root guard on a port or port-channel interface.                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>portfast</i><br/><i>[bpduguard</i><br/><i>[shutdown-on-violation]]</i></b> | Enter the keyword <code>portfast</code> to enable Portfast to move the interface into Forwarding mode immediately after the root fails.<br><br>Enter the optional keyword <code>bpduguard</code> to disable the port when it receives a BPDU.<br><br>Enter the optional keyword <code>shutdown-on-violation</code> to hardware disable an interface when a BPDU is received and the port is disabled.                                                                         |
| <b><i>priority priority</i></b>                                                  | Enter keyword <code>priority</code> then a number as the priority. The range is from zero (0) to 15. The default is <b>8</b> .                                                                                                                                                                                                                                                                                                                                                |

## Defaults

`cost` = depends on the interface type; `priority` = **8**

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                            |
|----------|----------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                            |
| 9.0.2.0  | Introduced on the S6000.                                                               |
| 8.3.19.0 | Introduced on the S4820T.                                                              |
| 8.3.11.1 | Introduced on the Z9000.                                                               |
| 8.3.10.1 | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the S4810. |

| Version | Description                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------|
| 8.4.2.1 | Introduced the <code>loopguard</code> and <code>rootguard</code> options on the E-Series TeraScale, C-Series, and S-Series. |
| 8.3.7.0 | Introduced on the S4810.                                                                                                    |
| 8.2.1.0 | Introduced the <code>shutdown-on-violation</code> option.                                                                   |
| 7.7.1.0 | Introduced on the S-Series.                                                                                                 |
| 7.5.1.0 | Introduced on the C-Series.                                                                                                 |
| 6.2.1.1 | Introduced on the E-Series.                                                                                                 |

### Usage Information

If you enable `portfast bpduguard` on an interface and the interface receives a BPDU, the software disables the interface and sends a message stating that fact. The port is in `ERR_DISABLE` mode, yet appears in the `show interface` commands as enabled. If you do not enable `shutdown-on-violation`, BPDUs are still sent to the RPM CPU.

STP loop guard and root guard are supported on a port or port-channel enabled in any Spanning Tree mode: Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and Per-VLAN Spanning Tree Plus (PVST+).

Root guard is supported on any STP-enabled port or port-channel except when used as a stacking port. When enabled on a port, root guard applies to all VLANs configured on the port.

STP root guard and loop guard cannot be enabled at the same time on a port. For example, if you configure loop guard on a port on which root guard is already configured, the following error message is displayed: `% Error: RootGuard is configured. Cannot configure LoopGuard.`

Do not enable Portfast BPDU guard and loop guard at the same time on a port. Enabling both features may result in a port that remains in a blocking state and prevents traffic from flowing through it. For example, when Portfast BPDU guard and loop guard are both configured:

- If a BPDU is received from a remote device, BPDU guard places the port in an Err-Disabled Blocking state and no traffic is forwarded on the port.
- If no BPDU is received from a remote device, loop guard places the port in a Loop-Inconsistent Blocking state and no traffic is forwarded on the port.

To display the type of STP guard (Portfast BPDU, root, or loop guard) enabled on a port, enter the `show spanning-tree 0` command.

## System Time and Date

The commands in this chapter configure time values on the system, either using the Dell Networking operating software, or the hardware, or using the network time protocol (NTP). With NTP, the switch can act only as a client to an NTP clock host.

For more information, refer to the “Network Time Protocol” section of the *Management* chapter in the *Dell Networking OS Configuration Guide*.

The commands in this chapter are generally supported on Dell Networking OS with some exceptions, as notes in the Command History fields.

### clock summer-time date

Set a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.

**Syntax** `clock summer-time time-zone date start-month start-day start-year start-time end-month end-day end-year end-time [offset]`  
 To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

| Parameters |                           |                                                                                                                                                      |
|------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b><i>time-zone</i></b>   | Enter the three-letter name for the time zone. This name is displayed in the show clock output.                                                      |
|            | <b><i>start-month</i></b> | Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year.        |
|            | <b><i>start-day</i></b>   | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year. |
|            | <b><i>start-year</i></b>  | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                               |
|            | <b><i>start-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                           |
|            | <b><i>end-day</i></b>     | Enter the number of the day. The range is from 1 to 31. You can enter the name of a month to change the order of the display to time day month year. |

|                         |                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>end-month</i></b> | Enter the name of one of the 12 months in English. You can enter the name of a day to change the order of the display to time day month year. |
| <b><i>end-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                    |
| <b><i>end-year</i></b>  | Enter a four-digit number as the year. The range is from 1993 to 2035.                                                                        |
| <b><i>offset</i></b>    | (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to1440. The default is <b>60 minutes</b> .   |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>          |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.6.1.0</b>  | Introduced on the S-Series. |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.1.1.0</b>  | Introduced on the E-Series. |

**Related Commands** [clock summer-time recurring](#) — sets a date (and time zone) on which to convert the switch to daylight saving time each year.

[show clock](#) — displays the current clock settings.

# clock summer-time recurring

Set the software clock to convert to daylight saving time on a specific day each year.

**Syntax** `clock summer-time time-zone recurring [start-week start-day start-month start-time end-week end-day end-month end-time [offset]]`

To delete a daylight saving time zone configuration, use the `no clock summer-time` command.

## Parameters

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>time-zone</i></b>   | Enter the three-letter name for the time zone. This name is displayed in the show clock output. You can enter up to eight characters.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>start-week</i></b>  | (OPTIONAL) Enter one of the following as the week that daylight saving begins and then enter values for start-day through end-time: <ul style="list-style-type: none"><li><code>week-number</code>: Enter a number from 1 to 4 as the number of the week in the month to start daylight saving time.</li><li><code>first</code>: Enter this keyword to start daylight saving time in the first week of the month.</li><li><code>last</code>: Enter this keyword to start daylight saving time in the last week of the month.</li></ul> |
| <b><i>start-day</i></b>   | Enter the name of the day that you want daylight saving time to begin. Use English three letter abbreviations; for example, Sun, Sat, Mon, and so on. The range is from Sun to Sat.                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>start-month</i></b> | Enter the name of one of the 12 months in English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>start-time</i></b>  | Enter the time in hours:minutes. For the hour variable, use the 24-hour format; example, 17:15 is 5:15 pm.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>end-week</i></b>    | Enter the one of the following as the week that daylight saving ends: <ul style="list-style-type: none"><li><code>week-number</code>: enter a number from 1 to 4 as the number of the week to end daylight saving time.</li><li><code>first</code>: enter the keyword <code>first</code> to end daylight saving time in the first week of the month.</li><li><code>last</code>: enter the keyword <code>last</code> to end daylight saving time in the last week of the month.</li></ul>                                               |
| <b><i>end-day</i></b>     | Enter the weekday name that you want daylight saving time to end. Enter the weekdays using the three letter abbreviations; for example Sun, Sat, Mon, and so on. The range is from Sun to Sat.                                                                                                                                                                                                                                                                                                                                         |
| <b><i>end-month</i></b>   | Enter the name of one of the 12 months in English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**end-time** Enter the time in hours:minutes:seconds. For the hour variable, use the 24-hour format; example, 17:15:00 is 5:15 pm.

**offset** (OPTIONAL) Enter the number of minutes to add during the summer-time period. The range is from 1 to 1440. The default is **60 minutes**.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                               |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                                               |
| 9.0.2.0  | Introduced on the S6000.                                                                                                                  |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                                 |
| 8.3.11.1 | Introduced on the Z9000.                                                                                                                  |
| 8.3.7.0  | Introduced on the S4810.                                                                                                                  |
| 7.6.1.0  | Introduced on the S-Series.                                                                                                               |
| 7.5.1.0  | Introduced on the C-Series.                                                                                                               |
| 7.4.1.0  | Updated the <code>start-day</code> and <code>end-day</code> options to allow for using the three-letter abbreviation of the weekday name. |
| 6.1.1.0  | Introduced on the E-Series.                                                                                                               |

**Related Commands** [clock summer-time date](#) — sets a date (and time zone) on which to convert the switch to daylight saving time on a one-time basis.

[show clock](#) — displays the current clock settings.

## clock timezone

Configure a timezone for the switch.

**Syntax** `clock timezone timezone-name offset`

To delete a timezone configuration, use the `no clock timezone` command.

## Parameters

|                             |                                                                                                                                                                                                                                                                            |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>timezone-name</i></b> | Enter the name of the timezone. You cannot use spaces.                                                                                                                                                                                                                     |
| <b><i>offset</i></b>        | Enter one of the following: <ul style="list-style-type: none"><li>• a number from 1 to 23 as the number of hours in addition to universal time coordinated (UTC) for the timezone.</li><li>• a minus sign (-) then a number from 1 to 23 as the number of hours.</li></ul> |

## Defaults

Not configured.

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Usage Information

Coordinated universal time (UTC) is the time standard based on the International Atomic Time standard, commonly known as Greenwich Mean time. When determining system time, include the differentiator between UTC and your local timezone. For example, San Jose, CA is the Pacific Timezone with a UTC offset of -8.

## debug ntp

Display network time protocol (NTP) transactions and protocol messages for troubleshooting.

### Syntax

```
debug ntp {adjust | all | authentication | events | loopfilter  
| packets | select | sync}
```

To disable debugging of NTP transactions, use the `no debug ntp {adjust | all | authentication | events | loopfilter | packets | select | sync}` command.

#### Parameters

|                       |                                                                                                          |
|-----------------------|----------------------------------------------------------------------------------------------------------|
| <b>adjust</b>         | Enter the keyword <code>adjust</code> to display information on NTP clock adjustments.                   |
| <b>all</b>            | Enter the keyword <code>all</code> to display information on all NTP transactions.                       |
| <b>authentication</b> | Enter the keyword <code>authentication</code> to display information on NTP authentication transactions. |
| <b>events</b>         | Enter the keyword <code>events</code> to display information on NTP events.                              |
| <b>loopfilter</b>     | Enter the keyword <code>loopfilter</code> to display information on NTP local clock frequency.           |
| <b>packets</b>        | Enter the keyword <code>packets</code> to display information on NTP packets.                            |
| <b>select</b>         | Enter the keyword <code>select</code> to display information on the NTP clock selection.                 |
| <b>sync</b>           | Enter the keyword <code>sync</code> to display information on the NTP clock synchronization.             |

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## ntp authenticate

Enable authentication of NTP traffic between the switch and the NTP time serving hosts.

**Syntax** `ntp authenticate`  
To disable NTP authentication, use the `no ntp authentication` command.

**Defaults** Not enabled.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage Information** You also must configure an authentication key for NTP traffic using the `ntp authentication-key` command.

## ntp authentication-key

Specify a key for authenticating the NTP server.

**Syntax** `ntp authentication-key number md5 [0 | 7] key`

**Parameters** *number* Specify a number for the authentication key. The range is from 1 to 4294967295.  
This number must be the same as the `number` parameter configured in the `ntp trusted-key` command.

|            |                                                                                  |
|------------|----------------------------------------------------------------------------------|
| <b>md5</b> | Specify that the authentication key is encrypted using MD5 encryption algorithm. |
| <b>0</b>   | Specify that authentication key is entered in an unencrypted format (default).   |
| <b>7</b>   | Specify that the authentication key is entered in DES encrypted format.          |
| <b>key</b> | Enter the authentication key in the previously specified format.                 |

**Defaults** NTP authentication is not configured by default. If you do not specify the option [0 | 7], **0** is selected by default.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>                                         |
|-----------------|------------------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                   |
| <b>8.2.1.0</b>  | Added options [0   7] for entering the authentication key. |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                |
| <b>6.1.1.0</b>  | Introduced on the E-Series.                                |

**Usage Information** After configuring the `ntp authentication-key` command, configure the `ntp trusted-key` command to complete NTP authentication.

Dell Networking OS versions 8.2.1.0 and later use an encryption algorithm to store the authentication key that is different from previous Dell Networking OS versions; beginning in version 8.2.1.0, Dell Networking OS uses DES encryption to store the key in the startup-config when you enter the `ntp authentication-key` command. Therefore, if your system boots with a startup-configuration from an Dell Networking OS versions prior to 8.2.1.0 in which you have configured `ntp authentication-key`, the system cannot correctly decrypt the key, and cannot authenticate NTP packets. In this case you must re-enter this command and save the running-config to the startup-config.

**Related Commands** [ntp authenticate](#) — enables NTP authentication.

[ntp trusted-key](#) — configures a trusted key.

## ntp broadcast client

Set up the interface to receive NTP broadcasts from an NTP server.

**Syntax** `ntp broadcast client`  
To disable broadcast, use the `no ntp broadcast client` command.

**Defaults** Disabled.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## ntp disable

Prevent an interface from receiving NTP packets.

**Syntax** `ntp disable`  
To re-enable NTP on an interface, use the `no ntp disable` command.

**Defaults** Disabled (that is, if you configure an NTP host, all interfaces receive NTP packets)

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## ntp multicast client

To receive NTP information from the network via multicast, configure the switch.

**Syntax** `ntp multicast client [multicast-address]`  
To disable multicast reception, use the `no ntp multicast client [multicast-address]` command.

**Parameters**

|                                 |                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>multicast-address</i></b> | (OPTIONAL) Enter a multicast address. Enter either an IPv4 address in dotted decimal format or an IPv6 address in X:X:X:X format. If you do not enter a multicast address, the address: <ul style="list-style-type: none"><li>• 224.0.1.1 is configured if the interface address is IPv4</li><li>• ff05::101 is configured if the interface address is IPv6</li></ul> |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** Not configured.

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                 |
|----------|---------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                 |
| 9.0.2.0  | Introduced on the S6000.                    |
| 8.3.19.0 | Introduced on the S4820T.                   |
| 8.3.11.1 | Introduced on the Z9000.                    |
| 8.4.1.0  | Added support for IPv6 multicast addresses. |
| 8.3.7.0  | Introduced on the S4810.                    |
| 6.1.1.0  | Introduced on the E-Series.                 |

## ntp master <stratum>

Configure the switch as NTP Server.

|                                  |                                                                                                                                                                                               |                                  |                                                                               |             |  |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|-------------------------------------------------------------------------------|-------------|--|
| <b>Syntax</b>                    | <code>ntp master &lt;stratum&gt;</code>                                                                                                                                                       |                                  |                                                                               |             |  |
| <b>Parameters</b>                | <table><tr><td><b>ntp master&lt;stratum&gt;</b></td><td>Enter the <code>stratum</code> number to identify the NTP Server's hierarchy.</td></tr><tr><td><b>&gt;</b></td><td></td></tr></table> | <b>ntp master&lt;stratum&gt;</b> | Enter the <code>stratum</code> number to identify the NTP Server's hierarchy. | <b>&gt;</b> |  |
| <b>ntp master&lt;stratum&gt;</b> | Enter the <code>stratum</code> number to identify the NTP Server's hierarchy.                                                                                                                 |                                  |                                                                               |             |  |
| <b>&gt;</b>                      |                                                                                                                                                                                               |                                  |                                                                               |             |  |
| <b>Defaults</b>                  | Not configured.                                                                                                                                                                               |                                  |                                                                               |             |  |
| <b>Command Modes</b>             | CONFIGURATION                                                                                                                                                                                 |                                  |                                                                               |             |  |
| <b>Command History</b>           | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                |                                  |                                                                               |             |  |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                      |
|----------|------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                      |
| 9.6(0.0) | Introduced on the S4810, S4820T, S5000, S6000, Z9000, and Z9500. |

## ntp server

Configure an NTP time-serving host.

**Syntax** `ntp server[vrf vrf-name] {hostname | ipv4-address | ipv6-address} [key keyid] [prefer] [version number]`

|                   |                                    |                                                                                                                                               |
|-------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>vrf vrf-name</b>                | (Optional) Enter the keyword <code>vrf</code> and then the name of the VRF to configure a NTP time-serving host corresponding to that VRF.    |
|                   | <b>ipv4-address   ipv6-address</b> | Enter an IPv4 address (A.B.C.D) or IPv6 address (X:X:X:X::X) of NTP server.                                                                   |
|                   | <b>hostname</b>                    | Enter the hostname of the server.                                                                                                             |
|                   | <b>key keyid</b>                   | (OPTIONAL) Enter the keyword <code>key</code> and a number as the NTP peer key. The range is from 1 to 4294967295.                            |
|                   | <b>prefer</b>                      | (OPTIONAL) Enter the keyword <code>prefer</code> to indicate that this peer has priority over other servers.                                  |
|                   | <b>version number</b>              | (OPTIONAL) Enter the keyword <code>version</code> and a number to correspond to the NTP version used on the server. The range is from 1 to 4. |

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.6(0.0)  | Added support for VRF.      |
| 9.4.(0.0) | Added support for VRF.      |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.11.1  | Introduced on the Z9000.    |
| 8.4.1.0   | Added IPv6 support.         |
| 7.6.1.0   | Introduced on the S-Series. |
| 7.5.1.0   | Introduced on the C-Series. |
| 6.1.1.0   | Introduced on the E-Series. |

## Usage Information

You can configure multiple time-serving hosts . From these time-serving hosts, the Dell Networking OS chooses one NTP host with which to synchronize. To determine which server was selected, use the `show ntp associations` command.

Because many polls to NTP hosts can impact network performance, Dell Networking recommends limiting the number of hosts configured.

## Related Commands

[show ntp associations](#) — displays the NTP servers configured and their status.

# ntp source

Specify an interface's IP address to be included in the NTP packets.

## Syntax

```
ntp source interface
```

To delete the configuration, use the `no ntp source` command.

## Parameters

### *interface*

Enter the following keywords and slot/port or number information:

- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.
- For a Loopback interface, enter the keyword `loopback` then a number from 0 to 16383.
- For a Port Channel interface, enter the keyword `lag` then a number. The range is from 1 to 128.
- For VLAN interface, enter the keyword `vlan` then a number from 1 to 4094.

## Defaults

Not configured.

## Command Modes

CONFIGURATION

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                                          |
|----------|------------------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                             |
| 8.3.11.1 | Introduced on the Z9000.                             |
| 8.5.1.0  | Added support for 4-port 40G line cards on ExaScale. |
| 7.6.1.0  | Introduced on the S-Series.                          |
| 7.5.1.0  | Introduced on the C-Series.                          |
| 6.1.1.0  | Introduced on the E-Series.                          |

## ntp trusted-key

Set a key to authenticate the system to which NTP synchronizes.

**Syntax** `ntp trusted-key number`  
 To delete the key, use the `no ntp trusted-key number` command.

**Parameters** `number` Enter a number as the trusted key ID. The range is from 1 to 4294967295.

**Defaults** Not configured.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.11.1 | Introduced on the Z9000.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage Information** The `number` parameter in the `ntp trusted-key` command must be the same number as the `number` parameter in the `ntp authentication-key` command. If you change the `ntp authentication-key` command, you must also change the `ntp trusted-key` command.

**Related  
Commands**

[ntp authentication-key](#) — sets an authentication key for NTP.

[ntp authenticate](#) — enables the NTP authentication parameters you set.

## show clock

Display the current clock settings.

**Syntax** `show clock [detail]`

**Parameters**

|               |                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------|
| <b>detail</b> | (OPTIONAL) Enter the keyword <code>detail</code> to view the source information of the clock. |
|---------------|-----------------------------------------------------------------------------------------------|

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Example**

```
Dell#show clock
11:05:56.949 UTC Thu Oct 25 2001
Dell#
```

**Example (Detail)**

```
Dell#show clock detail
12:18:10.691 UTC Wed Jan 7 2009
Time source is RTC hardware
Summer time starts 02:00:00 UTC Sun Mar 8 2009
Summer time ends 02:00:00 ABC Sun Nov 1 2009
Dell#
```

**Related  
Commands**

[clock summer-time recurring](#) — displays the time and date from the switch hardware clock.

## show ntp associations

Display the NTP master and peers.

**Syntax** `show ntp associations`

**Command  
Modes**

- EXEC
- EXEC Privilege

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

**Usage  
Information**

The following describes the `show ntp associations` command shown in the Example below.

| Field  | Description                                                                                                                                                                                                                                                                                                                                                                           |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| (none) | One or more of the following symbols could be displayed: <ul style="list-style-type: none"><li>• * means synchronized to this peer.</li><li>• # means almost synchronized to this peer.</li><li>• + means the peer was selected for possible synchronization.</li><li>• - means the peer is a candidate for selection.</li><li>• ~ means the peer is statically configured.</li></ul> |

| Field            | Description                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>remote</b>    | Displays the remote IP address of the NTP peer.                                                                                                                   |
| <b>ref clock</b> | Displays the IP address of the remote peer's reference clock.                                                                                                     |
| <b>st</b>        | Displays the peer's stratum, that is, the number of hops away from the external time source. A 16 in this column means the NTP peer cannot reach the time source. |
| <b>when</b>      | Displays the last time the switch received an NTP packet.                                                                                                         |
| <b>poll</b>      | Displays the polling interval (in seconds).                                                                                                                       |
| <b>reach</b>     | Displays the reachability to the peer (in octal bitstream).                                                                                                       |
| <b>delay</b>     | Displays the time interval or delay for a packet to complete a round-trip to the NTP time source (in milliseconds).                                               |
| <b>offset</b>    | Displays the relative time of the NTP peer's clock to the switch clock (in milliseconds).                                                                         |
| <b>disp</b>      | Displays the dispersion.                                                                                                                                          |

### Example

```
Dell#show ntp associations
remote      ref clock  st when poll reach delay  offset disp

### Related Commands

[show ntp status](#) — displays the current NTP status.

## show ntp vrf associations

Displays the NTP servers configured for the VRF instance <vrf-name>.

**Syntax** show ntp [*vrf*] <*vrf-name*> associations.

**Command** EXEC

**Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.6(0.0)  | Added support for VRF.      |
| 9.4.(0.0) | Added support for VRF.      |
| 9.0.2.0   | Introduced on the S6000.    |
| 8.3.11.1  | Introduced on the Z9000.    |
| 8.4.1.0   | Added IPv6 support.         |
| 7.6.1.0   | Introduced on the S-Series. |
| 7.5.1.0   | Introduced on the C-Series. |
| 6.1.1.0   | Introduced on the E-Series. |

## show ntp status

Display the current NTP status.

**Syntax** `show ntp status`

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.1.1.0  | Introduced on the E-Series. |

## Usage Information

The following describes the `show ntp status` command shown in the Example below.

| Field                   | Description                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| "Clock is..."           | States whether or not the switch clock is synchronized, which NTP stratum the system is assigned and the IP address of the NTP peer. |
| "frequency is..."       | Displays the frequency (in ppm), stability (in ppm) and precision (in Hertz) of the clock in this system.                            |
| "reference time is..."  | Displays the reference time stamp.                                                                                                   |
| "clock offset is..."    | Displays the system offset to the synchronized peer and the time delay on the path to the NTP root clock.                            |
| "root dispersion is..." | Displays the root and path dispersion.                                                                                               |
| "peer mode is..."       | State what NTP mode the switch is. This should be Client mode.                                                                       |

## Example

```
Dell#show ntp status
Clock is synchronized, stratum 2, reference is 100.10.10.10
frequency is -32.000 ppm, stability is 15.156 ppm, precision
is 4294967290
reference time is BC242FD5.C7C5C000 (10:15:49.780 UTC Mon Jan
10 2000)
clock offset is clock offset msec, root delay is 0.01656 sec
root dispersion is 0.39694 sec, peer dispersion is peer
dispersion msec
peer mode is client
Dell#
```

## Related Commands

[show ntp associations](#) — displays information on the NTP master and peer configurations.

## u-Boot

All commands in this chapter are in u-Boot and are supported on the Dell Networking S4810 and 4820T platforms only.

To access this mode, press any key when the following line appears on the console during a system boot.

```
Hit any key to stop autoboot:
```

Enter u-Boot immediately, as the => prompt indicates.

 **NOTE:** This chapter describes only a few commands available in u-Boot. The commands included here are those commands that are comparable to those commands found in Boot User mode on other S-Series systems.

 **NOTE:** You cannot use the Tab key to complete commands in this mode.

## printenv

Display the current system boot variable and other system settings.

**Syntax**                    `printenv`

**Command**                 `uBoot`

**Modes**

**Command History**        This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version**                    Introduced on the S4820T.  
**8.3.19.0**

**Version 8.3.7.0**            Introduced on the S4810.

**Example**

```
=> printenv
baudrate=9600
uboot_filesize=0x80000
bootfile=FTOS-SC-1.2.0.0E3.bin
bootcmd=echo Booting primary bootline...;
$primary_boot;boot;echo
Failed;echo Booting secondary bootline...;
$secondary_boot;boot;echo
Failed;echo Booting default bootline...;
$default_boot;boot;echo Failed;echo
```

```

Rebooting...;reset
bootdelay=5
loads_echo=1
rootpath=/opt/nfsroot
hostname=unknown
loadaddr=640000
ftpuser=force10
ftppasswd=force10
uboot=u-boot.bin
tftpflash=tftpboot $loadaddr $uboot; protect off 0xffff80000 +
$filesize;
erase 0x
fff80000 +$filesize; cp.b $loadaddr 0xffff80000 $filesize;
protect on
0xffff80000
+$filesize; cmp.b $loadaddr 0xffff80000 $filesize
ethact=eTSEC1
ethaddr=00:01:E8:82:09:B2
serverip=10.11.9.4

primary_boot=f10boot tftp://10.11.9.2/si-S4810-40g
secondary_boot=f10boot flash0
default_boot=f10boot tftp://192.168.128.1/FTOS-SC-1.2.0.0E3.bin

gatewayip=10.11.192.254

ipaddr=10.11.198.114

netmask=255.255.0.0
mgmtautoneg=true
mgmtspeed100=true
mgmtfullduplex=true
stdin=serial
stdout=serial
stderr=serial
Environment size: 1002/8188 bytes
=>

```

#### Usage Information

- ethaddr=00:01:E8:82:09:B2 is the MAC address.
- primary\_boot=f10boot tftp://10.11.9.2/si-S4810-40g, secondary\_boot=f10boot flash0, and default\_boot=f10boot tftp://192.168.128.1/FTOS-SC-1.2.0.0E3.bin are the boot variables.
- gatewayip=10.11.192.254 is the default gateway address.
- ipaddr=10.11.198.114 is the management IP address.

## reset

Reload the system.

**Syntax** `reset`

**Command Modes** uBoot

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version 8.3.19.0** Introduced on the S4820T.

**Version 8.3.7.0** Introduced on the S4810.

**Usage Information** Save your changes before resetting the system or all your changes will be lost.

## save

Save configurations created in uBoot.

**Syntax** `save`

**Command Modes** uBoot

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version 8.3.19.0** Introduced on the S4820T.

**Version 8.3.7.0** Introduced on the S4810.

**Usage Information** Save your changes before resetting the system or all your changes will be lost.

# setenv

Configure system settings.

**Syntax** `setenv [gatewayip address | primary_image f10boot location | secondary_image f10boot location | default_image f10boot location | ipaddr address | ethaddr address | enablepwdignore | stconfigignore]`

## Parameters

- gatewayip address** Enter the IP address for the default gateway.
- primary\_image** Enter the keywords `primary_image` to configure the boot parameters used in the first attempt to boot Dell Networking OS.
- secondary\_image** Enter the keywords `secondary_image` to configure boot parameters used if the primary operating system boot selection is not available.
- default\_image** Enter the keywords `default_image` to configure boot parameters used if the secondary operating system boot parameter selection is not available.

**NOTE:** The default location should always be the internal flash device (`flash:`), and a verified image should be stored there.

- location** Enter the location of the image file to be loaded. When using this command, the keyword `f10boot` must precede the location. For example, `primary_image f10boot tftp://10.10.10.10/server`.
- ipaddr** Enter the keyword `ippaddr` to configure the system management IP address.
- ethaddr** Enter the keyword `ethaddr` to configure system management MAC address.
- address** Enter the IP address in standard IPv4 format and the MAC address in standard MAC format.
- enablepwdignore** Enter the keywords `enableprdigignore true` to reload the system software without the enable password configured.
- stconfigignore** Enter the keywords `stconfigignore true` to ignore the startup configuration file when reloading the system.

## Command Modes

uBoot

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

**Version**                      Introduced on the S4820T.  
**8.3.19.0**

**Version 8.3.7.0**              Introduced on the S4810.

# Tunneling

Tunneling is supported on Dell Networking OS.

## ip unnumbered

Configure a tunnel interface to operate without a unique IPv4 address and select the interface from which the tunnel borrows its address.

**Syntax**                    **ip unnumbered** *{interface-type slot/port}*

To set the tunnel back to default logical address use the **no ip unnumbered** command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv6 address.

**Parameters**

|                         |                                                      |
|-------------------------|------------------------------------------------------|
| <i>interface-type</i>   | Enter the interface type, followed by a slot number. |
| <i>interface-number</i> |                                                      |

**Defaults**                    None

**Command Modes**            INTERFACE TUNNEL

**Command History**

| Version  | Description                                       |
|----------|---------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                       |
| 9.5(0.1) | Introduced on the Z9500.                          |
| 9.4(0.1) | Introduced on the S4810, S4820T, S6000 and Z9000. |

**Usage Information**

The ip unnumbered command fails in two conditions:

- If the logical ip address is configured.
- If Tunnel mode is ipv6ip (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

 **NOTE:** The `ip unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical ip address is identified from one of the address family.

## ipv6 unnumbered

Configure a tunnel interface to operate without a unique IPv6 address and select the interface from which the tunnel borrows its address.

**Syntax** `ipv6 unnumbered {interface-type interface-number}`  
To set the tunnel back to default logical address use the **no ipv6 unnumbered** command. If the tunnel was previously operational, the tunnel interface is operationally down unless you also configure the tunnel IPv4 address.

**Parameters**

|                         |                                                                            |
|-------------------------|----------------------------------------------------------------------------|
| <i>interface-type</i>   | Enter the interface type, followed by the type, slot and port information. |
| <i>interface-number</i> |                                                                            |

**Defaults** None.

**Command Modes** INTERFACE TUNNEL

**Command History**

| Version  | Description                        |
|----------|------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.        |
| 9.5(0.1) | Introduced on the Z9500.           |
| 9.4(0.0) | Introduced on the S4810, S4820T.   |
| 9.3(0.1) | Introduced on the S6000 and Z9000. |

**Usage Information**

The `ip unnumbered` command fails in two conditions:

- If the logical ip address is configured.
- If Tunnel mode is `ipv6ip` (where ip address over tunnel interface is not possible).

To ping the unnumbered tunnels, the logical address route information must be present at both the ends.

 **NOTE:** The `ipv6 unnumbered` command can specify an interface name that does not exist or does not have a configured IPv6 address. The tunnel interface is not changed to operationally up until the logical ip address is identified from one of the address family.

## tunnel allow-remote

Configure an IPv4 or IPv6 address or prefix whose tunneled packets are accepted for decapsulation. If you do not configure allow-remote entries, tunneled packets from any remote peer address is accepted.

This feature is supported on Dell Networking OS.

**Syntax** `tunnel allow-remote {ip-address | ipv6-address} [mask]`  
To delete a configured allow-remote entry use the **no** `tunnel allow-remote` command. Any specified address/mask values must match an existing entry for the delete to succeed. If the address and mask are not specified, this command deletes all allow-remote entries.

**Parameters**

|                     |                                                                                                                                                                                                                         |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>   | Enter the source IPv4 address in A.B.C.D format.                                                                                                                                                                        |
| <i>ipv6-address</i> | Enter the source IPv6 address in X:X:X:X format.                                                                                                                                                                        |
| <i>mask</i>         | (OPTIONAL) Enter a network mask in /prefix format (/x) or A.B.C.D to match a range of remote addresses. The default mask is /32 for IPv4 addresses and /128 for IPv6 addresses, which match only the specified address. |

**Defaults** If you do not configure tunnel allow remote , all traffic which is destined to tunnel source address is decapsulated.

**Command Modes** INTERFACE TUNNEL

**Command History**

| Version  | Description                                       |
|----------|---------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                       |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000 and Z9000. |
| 9.3(0.1) | Introduced on the S6000 and Z9000.                |

**Usage Information** You can configure up to eight allow-remote entries on any multipoint receive-only tunnel.

This command fails if the address family entered does not match the outer header address family of the tunnel mode, tunnel source, or any other tunnel allow-remote.

If you configure any allow-remote , the tunnel source or tunnel mode commands fail if the outer header address family does not match that of the configured allow-remote.

## tunnel destination

Set a destination endpoint for the tunnel.

**Syntax** `tunnel destination {ip-address | ipv6-address}`  
To delete a tunnel destination address, use the `no tunnel destination {ip-address | ipv6-address}` command.

**Parameters**

|                            |                                                    |
|----------------------------|----------------------------------------------------|
| <b><i>ip-address</i></b>   | Enter the destination IPv4 address for the tunnel. |
| <b><i>ipv6-address</i></b> | Enter the destination IPv6 address for the tunnel. |

**Defaults** none

**Command Modes** INTERFACE TUNNEL (conf-if-tu)

**Command History**

| Version  | Description                                       |
|----------|---------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                       |
| 9.5(0.1) | Introduced on the Z9500.                          |
| 9.3(0.0) | Introduced on the S4810, S4820T, S6000 and Z9000. |

**Usage Information** The tunnel interface is inoperable without a valid tunnel destination address for the configured Tunnel mode.

To establish a logical tunnel to the particular destination address, use the destination address of the outer tunnel header. If you configure a tunnel interface or source address, the tunnel destination must be compatible.

## tunnel dscp

Configure the method to set the DSCP in the outer tunnel header.

### C9000 Series

**Syntax** `tunnel dscp {mapped | value}`  
To use the default tunnel mapping behavior, use the `no tunnel dscp value` command.

**Parameters**

|               |                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>mapped</b> | Enter the keyword <code>mapped</code> to map the original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel. |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|                          |                                                                                                                                                                          |                                                                                                                                                                                                                                                                               |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>value</b>                                                                                                                                                             | Enter a value to set the DSCP value in the tunnel header. The range is from 0 to 63. The default value of <b>0</b> denotes mapping of original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel. |
| <b>Defaults</b>          | 0 (Mapped)                                                                                                                                                               |                                                                                                                                                                                                                                                                               |

|                          | 9.3(0.0)                                                                                                                                                                 | Introduced on the S6000, S4810, S4820T, Z9000.                                                                                                                                                                                                                                |
| <b>Usage Information</b> | This command configures the method used to set the high 6 bits (the differentiated services codepoint) of the IPv4 TOS or the IPv6 traffic class in the outer IP header. |                                                                                                                                                                                                                                                                               |
|                          | A value of 0 copies original packet DSCP (IPv4)/Traffic Class (IPv6) to the tunnel header DSCP (IPv4)/Traffic Class (IPv6) depending on the mode of tunnel.              |                                                                                                                                                                                                                                                                               |

## tunnel flow-label

Configure the method to set the IPv6 flow label value in the outer tunnel header.

|                        |                                                                                               |                                                                                                                                      |
|------------------------|-----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>tunnel flow-label value</code>                                                          |                                                                                                                                      |
|                        | To return to the default value of 0, use the <code>no tunnel flow-label value</code> command. |                                                                                                                                      |
| <b>Parameters</b>      | <b>value</b>                                                                                  | Enter a value to set the IPv6 flow label value in the tunnel header. The range is from 0 to 1048575. The default value is <b>0</b> . |
| <b>Defaults</b>        | <b>0</b> (Mapped original packet flow-label value to tunnel header flow-label value)          |                                                                                                                                      |
| <b>Command Modes</b>   | INTERFACE TUNNEL (conf-if-tu)                                                                 |                                                                                                                                      |
| <b>Command History</b> | <b>Version</b>                                                                                | <b>Description</b>                                                                                                                   |
|                        | 9.7(0.0)                                                                                      | Introduced on the S6000-ON.                                                                                                          |

| Version  | Description                                    |
|----------|------------------------------------------------|
| 9.5(0.1) | Introduced on the Z9500.                       |
| 9.3(0.0) | Introduced on the S6000, S4810, S4820T, Z9000. |

#### Usage Information

This command is only valid for tunnel interfaces with an IPv6 outer header.

## tunnel hop-limit

Configure the method to set the IPv4 time-to-live or the IPv6 hop limit value in the outer tunnel header.

#### Syntax

`tunnel hop-limit value`

To restore the default tunnel hop-limit, use the `no tunnel hop-limit` command.

#### Parameters

**value**

Enter the hop limit (ipv6) or time-to-live (ipv4) value to include in the tunnel header. The range is from 0 to 255. The default is **64**.

#### Defaults

**64** (Time-to-live for IPv4 outer tunnel header or hop limit for IPv6 outer tunnel header)

#### Command Modes

INTERFACE TUNNEL (conf-if-tu)

#### Command History

| Version  | Description                                    |
|----------|------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                    |
| 9.5(0.1) | Introduced on the Z9500.                       |
| 9.3(0.0) | Introduced on the S6000, S4810, S4820T, Z9000. |

#### Usage Information

A value of 0 copies the inner packet hop limit (ipv6) or time-to-live (ipv4) in the encapsulated packet to the tunnel header hop limit (ipv6) or time-to-live (ipv4) value.

# tunnel keepalive

Configure the tunnel keepalive target, interval and attempts.

**Syntax** `tunnel keepalive {ip-address | ipv6-address}[interval {seconds}] [attempts {count | unlimited}]`

To disable the tunnel keepalive probes use the **no tunnel keepalive** command.

## Parameters

|                                       |                                                                                                                                                                                              |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address ipv6 address</i></b> | Enter the IPv4 or IPv6 address of the peer to which the keepalive probes will be sent.                                                                                                       |
| <b><i>interval seconds</i></b>        | Enter the keyword <code>interval</code> then the interval time, in seconds, after which the restart process to keepalive probe packets.<br><br>The range is from 5 to 255. The default is 5. |
| <b><i>count</i></b>                   | (OPTIONAL) Enter the keyword <b>count</b> to count packets processed by the filter.<br><br>The range is from 3 to 10. The default is 3.                                                      |
| <b><i>unlimited</i></b>               | Enter the keyword <b>unlimited</b> to specify the unlimited number of keepalive probe packets.                                                                                               |

## Defaults

Tunnel keepalive is disabled.

## Command Modes

INTERFACE TUNNEL

| 9.7(0.0) | Introduced on the S6000-ON.                       |
| 9.5(0.1) | Introduced on the Z9500.                          |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000 and Z9000. |

## Usage Information

Enabling tunnel keepalive causes ICMP echo packets to be sent to the keepalive target. The ICMP echo will be sourced from the tunnel interface logical IPv4 or IPv6 address and will be tunnel encapsulated. The response will be accepted whether it returns tunnel encapsulated or not.

When configuring tunnel keepalive at both end points of a tunnel interface it is recommended to set the tunnel keepalive target to the logical IPv4 or IPv6 address of the far end tunnel peer, rather than to the tunnel destination. This reduces the chance of both ends of the tunnel staying in keepalive down state. If both ends get

into a keepalive down state that does not clear in a few seconds, then performing shutdown - no shutdown sequence on one end should bring both ends back to up.

## tunnel-mode

Enable a tunnel interface.

.

**Syntax** `tunnel mode {ipip | ipv6 | ipv6ip}[decapsulate-any]`  
To disable an active tunnel interface, use the **no tunnel mode** command.

**Parameters**

|                        |                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------|
| <i>ipip</i>            | Enable tunnel in RFC 2003 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv4 tunnel. |
| <i>ipv6</i>            | Enable tunnel in RFC 2473 mode and encapsulate IPv4 and/or IPv6 datagrams inside an IPv6 tunnel. |
| <i>ipv6ip</i>          | Enable tunnel in RFC 4213 mode and encapsulate IPv6 datagrams inside an IPv4 tunnel.             |
| <i>decapsulate-any</i> | (Optional) Enable tunnel in multipoint receive-only mode.                                        |

**Defaults** There is no default tunnel mode.

**Command Modes** INTERFACE TUNNEL

**Command History**

| Version  | Description                        |
|----------|------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.        |
| 9.5(0.1) | Introduced on the Z9500.           |
| 9.4(0.0) | Added the decapsulate-any command. |
| 9.3(0.1) | Introduced on the S6000 and Z9000. |

**Usage Information** To enable a tunnel interface, use this command. You must define a tunnel mode for the tunnel to function. If you previously defined the tunnel destination or source address, the tunnel mode must be compatible.

Including the decapsulate-any option causes the command to fail if any of the following tunnel transmit options are configured: tunnel destination, tunnel dscp, tunnel flow-label, tunnel hop-limit, or tunnel keepalive. Conversely, if you configure any tunnel allow-remote entries, the `tunnel-mode` command fails unless the decapsulate-any option is included.

Configuration of IPv6 commands over decapsulate-any tunnel causes an error.

## tunnel source

Set a source address for the tunnel.

**Syntax** `tunnel source {ip-address | ipv6-address | interface-type-number | anylocal}`

To delete the current tunnel source address, use the `no tunnel source` command.

### Parameters

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ip-address</i>            | Enter the source IPv4 address in A.B.C.D format.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>ipv6-address</i>          | Enter the source IPv6 address in X:X:X:X format.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>interface-type-number</i> | <ul style="list-style-type: none"><li>For a port channel interface, enter the keywords <code>port-channel</code> then a number from 1 to 128.</li><li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li><li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li><li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li></ul> |
| <i>anylocal</i>              | Enter the <code>anylocal</code> command to allow the multipoint receive-only tunnel to decapsulate tunnel packets destined to any local ip address.                                                                                                                                                                                                                                                                                                                                                          |

**Defaults** none

**Command Modes** INTERFACE TUNNEL (conf-if-tu)

| Command History | Version  | Description                                       |
|-----------------|----------|---------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                       |
|                 | 9.5(0.1) | Introduced on the Z9500.                          |
|                 | 9.4(0.0) | Added the tunnel source anylocal command.         |
|                 | 9.3(0.0) | Introduced on the S4810, S4820T, S6000 and Z9000. |

**Usage Information** Added an optional keyword **"anylocal"** to the tunnel source command. The anylocal argument can be used in place of the ip address or interface, but only with the multipoint receive-only mode tunnels. The tunnel source `anylocal` command

allows the multipoint receive-only tunnel to decapsulate tunnel packets addressed to any IPv4 or IPv6 (depending on the tunnel mode) address configured on the switch that is operationally **Up**.

# Uplink Failure Detection (UFD)

Uplink failure detection (UFD) provides detection of the loss of upstream connectivity and, if you use this with NIC teaming, automatic recovery from a failed link.

## clear ufd-disable

Re-enable one or more downstream interfaces on the switch/router that are in a UFD-Disabled Error state so that an interface can send and receive traffic.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>clear ufd-disable {interface <i>interface</i>   uplink-state-group <i>group-id</i>}</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Parameters</b>      | <p><b>interface</b><br/><b><i>interface</i></b></p> <p>Specify one or more downstream interfaces. For <i>interface</i>, enter one of the following interface types:</p> <ul style="list-style-type: none"> <li>• 10 Gigabit Ethernet: <code>tengigabitethernet {<i>slot/port</i>   <i>slot/port-range</i>}</code></li> <li>• 40-Gigabit Ethernet: <code>fortyGigE {<i>slot/port</i>}</code></li> <li>• Port channel: <code>port-channel {<i>1-128</i>   <i>port-channel-range</i>}</code></li> </ul> <p>Where <i>port-range</i> and <i>port-channel-range</i> specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example:<br/> <code>gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5</code>. A comma is required to separate each port and port-range entry.</p> <p><b>uplink-state-group</b><br/><b><i>group-id</i></b></p> <p>Re-enables all UFD-disabled downstream interfaces in the group. The valid <i>group-id</i> values are from 1 to 16.</p> |
| <b>Defaults</b>        | A downstream interface in a UFD-disabled uplink-state group is also disabled and is in a UFD-Disabled Error state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Command Modes</b>   | CONFIGURATION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Command History</b> | <p>This guide is platform-specific. | Version  | Description                     |
|----------|---------------------------------|
| 8.3.19.0 | Introduced on the S4820T.       |
| 8.3.12.0 | Introduced on the S4810.        |
| 8.4.2.3  | Introduced on the S-Series S50. |

#### Related Commands

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## debug uplink-state-group

Enable debug messages for events related to a specified uplink-state group or all groups.

### S4820T

#### Syntax

```
debug uplink-state-group [group-id]
```

To turn off debugging event messages, enter the `no debug uplink-state-group [group-id]` command.

#### Parameters

**group-id** Enables debugging on the specified uplink-state group. The valid group-id values are from 1 to 16.

#### Defaults

none

#### Command Modes

EXEC Privilege

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

**Related Commands**      [clear ufd-disable](#) — re-enables downstream interfaces that are in a UFD-Disabled Error state.

## description

Enter a text description of an uplink-state group.

**Syntax**                    `description text`

**Parameters**              **text**                    Text description of the uplink-state group. The maximum length is 80 alphanumeric characters.

**Defaults**                  none

**Command Modes**            UPLINK-STATE-GROUP

**Version 9.2(0.0)**          Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only.

**Command History**          This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

**Example**                    `Dell (conf-uplink-state-group-16) # description test`  
`Dell (conf-uplink-state-group-16) #`

**Related Commands**        [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# downstream

Assign a port or port-channel to the uplink-state group as a downstream interface.

**Syntax** `downstream interface`  
To delete an uplink-state group, enter the `no downstream interface` command.

**Parameters** *interface* Enter one of the following interface types:

- 10 Gigabit Ethernet: `tengigabitethernet {slot/port | slot/port-range}`
- 40-Gigabit Ethernet: `fortyGigE {slot/port}`
- Port channel: `port-channel {1-128 | port-channel-range}`

Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example: `gigabitethernet 1/1-2,5,9,11-12 port-channel 1-3,5`. A comma is required to separate each port and port-range entry.

**Defaults** none

**Command Modes** UPLINK-STATE-GROUP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

**Usage Information** You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

#### Related Commands

- [upstream](#) — assigns a port or port-channel to the uplink-state group as an upstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## downstream auto-recover

Enable auto-recovery so that UFD-disabled downstream ports in an uplink-state group automatically come up when a disabled upstream port in the group comes back up.

#### Syntax

```
downstream auto-recover
```

To disable auto-recovery on downstream links, use the `no downstream auto-recover` command.

#### Defaults

The auto-recovery of UFD-disabled downstream ports is enabled.

#### Command Modes

UPLINK-STATE-GROUP

#### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

#### Related Commands

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

## downstream disable links

Configure the number of downstream links in the uplink-state group that are disabled if one upstream link in an uplink-state group goes down.

| <b>Syntax</b>            | <code>downstream disable links {number  all}</code><br>To revert to the default setting, use the <code>no downstream disable links</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                      |                                                                                              |                   |                                                                                                     |          |                           |          |                          |         |                                 |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|----------------------------------------------------------------------------------------------|-------------------|-----------------------------------------------------------------------------------------------------|----------|---------------------------|----------|--------------------------|---------|---------------------------------|
| <b>Parameters</b>        | <table><tr><td><b><i>number</i></b></td><td>Enter the number of downstream links to be brought down by UFD. The range is from 1 to 1024.</td></tr><tr><td><b><i>all</i></b></td><td>Brings down all downstream links in the group.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b><i>number</i></b> | Enter the number of downstream links to be brought down by UFD. The range is from 1 to 1024. | <b><i>all</i></b> | Brings down all downstream links in the group.                                                      |          |                           |          |                          |         |                                 |
| <b><i>number</i></b>     | Enter the number of downstream links to be brought down by UFD. The range is from 1 to 1024.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                      |                                                                                              |                   |                                                                                                     |          |                           |          |                          |         |                                 |
| <b><i>all</i></b>        | Brings down all downstream links in the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                      |                                                                                              |                   |                                                                                                     |          |                           |          |                          |         |                                 |
| <b>Defaults</b>          | No downstream links are disabled when an upstream link in an uplink-state group goes down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                      |                                                                                              |                   |                                                                                                     |          |                           |          |                          |         |                                 |

# enable

Enable uplink state group tracking for a specific UFD group.

**Syntax**                    `enable`  
To disable upstream-link tracking without deleting the uplink-state group, use the `no enable` command.

**Defaults**                    Upstream-link tracking is automatically enabled in an uplink-state group.

**Command Modes**            UPLINK-STATE-GROUP

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T                                                                            |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

**Related Commands**            • [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# show running-config uplink-state-group

Display the current configuration of one or more uplink-state groups.

**Syntax**                    `show running-config uplink-state-group [group-id]`

**Parameters**                    *group-id*                    Displays the current configuration of all uplink-state groups or a specified group. The valid group-id values are from 1 to 16.

**Defaults**                    none

**Command Modes**            • EXEC  
• EXEC Privilege

## Command History

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

## Example

```
Dell#show running-config uplink-state-group
!
no enable
uplink state track 1
downstream TenGigabitEthernet 1/2,4,6,11-19
upstream FortyGigabitEthernet 1/27, 29
upstream PortChannel 1
!
uplink state track 2
downstream TenGigabitEthernet 1/1,3,5,7-10
upstream FortyGigabitEthernet 1/31,42
```

## Related Commands

- [show uplink-state-group](#) — displays the status information on a specified uplink-state group or all groups.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# show uplink-state-group

Display status information on a specified uplink-state group or all groups.

**Syntax** `show uplink-state-group [group-id] [detail]`

| Parameters      |  |                                                                                                                          |
|-----------------|--|--------------------------------------------------------------------------------------------------------------------------|
| <b>group-id</b> |  | Displays status information on a specified uplink-state group or all groups. The valid group-id values are from 1 to 16. |
| <b>detail</b>   |  | Displays additional status information on the upstream and downstream interfaces in each group                           |

**Defaults** none

**Command Modes**

- EXEC
- EXEC Privilege

## Related Commands

- [show running-config uplink-state-group](#) — displays the current configuration of one or more uplink-state groups.

- [uplink-state-group](#) — create an uplink-state group and enables the tracking of upstream links.

## uplink-state-group

Create an uplink-state group and enable the tracking of upstream links on a switch/ router.

**Syntax** `uplink-state-group group-id`  
 To delete an uplink-state group, enter the `no uplink-state-group group-id` command.

**Parameters**

|                 |                                                                          |
|-----------------|--------------------------------------------------------------------------|
| <b>group-id</b> | Enter the ID number of an uplink-state group. The range is from 1 to 16. |
|-----------------|--------------------------------------------------------------------------|

**Defaults** none

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------|
| <b>9.2(0.0)</b> | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                           |
| <b>8.3.12.0</b> | Introduced on the S4810.                                                                            |
| <b>8.4.2.3</b>  | Introduced on the S-Series S50.                                                                     |

**Usage Information** After you enter the command, to assign upstream and downstream interfaces to the group, enter Uplink-State-Group Configuration mode.

An uplink-state group is considered to be operationally up if at least one upstream interface in the group is in the Link-Up state.

An uplink-state group is considered to be operationally down if no upstream interfaces in the group are in the Link-Up state. No uplink-state tracking is performed when a group is disabled or in an operationally down state.

To disable upstream-link tracking without deleting the uplink-state group, use the `no enable` command in uplink-state-group configuration mode.

### Example

```
Dell(conf)#uplink-state-group 16
Dell(conf)#
02:23:17: %RPM0-P:CP %IFMGR-5-ASTATE_UP: Changed uplink state
group Admin state to up: Group 16
```

### Related Commands

- [show running-config uplink-state-group](#) — displays the current configuration of one or more uplink-state groups.
- [show uplink-state-group](#) — displays the status information on a specified uplink-state group or all groups.

## upstream

Assign a port or port-channel to the uplink-state group as an upstream interface.

### Syntax

```
upstream interface
```

To delete an uplink-state group, use the `no upstream interface` command.

### Parameters

#### *interface*

Enter one of the following interface types:

- 10 Gigabit Ethernet: `tengigabitethernet {slot/port | slot/port-range}`
- 40-Gigabit Ethernet: `fortyGigE {slot/port}`
- Port channel: `port-channel {1-128 | port-channel-range}`

Where `port-range` and `port-channel-range` specify a range of ports separated by a dash (-) and/or individual ports/port channels in any order; for example:

```
gigabitethernet 1/1-2,5,9,11-12 port-channel
1-3,5. A comma is required to separate each port and port-
range entry.
```

### Defaults

none

### Command Modes

UPLINK-STATE-GROUP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |
| 8.4.2.3  | Introduced on the S-Series S50.                                                                     |

### Usage Information

You can assign physical port or port-channel interfaces to an uplink-state group.

You can assign an interface to only one uplink-state group. Configure each interface assigned to an uplink-state group as either an upstream or downstream interface, but not both.

You can assign individual member ports of a port channel to the group. An uplink-state group can contain either the member ports of a port channel or the port channel itself, but not both.

### Example

```
Dell(conf-uplink-state-group-16) # upstream tengigabitethernet
1/10-15
Dell(conf-uplink-state-group-16) #
```

### Related Commands

- [downstream](#) — assigns a port or port-channel to the uplink-state group as a downstream interface.
- [uplink-state-group](#) — creates an uplink-state group and enables the tracking of upstream links.

# VLAN Stacking

With the virtual local area network (VLAN)-stacking feature (also called stackable VLANs and QinQ), you can “stack” VLANs into one tunnel and switch them through the network transparently.

The Dell Networking operating software supports this feature on Dell Networking OS.

For more information about basic VLAN commands, refer to the *Virtual LAN (VLAN) Commands* section in the [Layer 2](#) chapter.

## Important Points to Remember

- If you do not enable the spanning tree protocol (STP) across the stackable VLAN network, STP bridge protocol data units (BPDUs) from the customer’s networks are tunneled across the stackable VLAN network.
- If you do enable STP across the stackable VLAN network, STP BPDUs from the customer’s networks are consumed and not tunneled across the stackable VLAN network unless you enable protocol tunneling.

 **NOTE:** For more information about protocol tunneling on the E-Series, refer to [Service Provider Bridging](#).

- Layer 3 protocols are not supported on a stackable VLAN network.
- Assigning an IP address to a stackable VLAN is supported when all the members are only stackable VLAN trunk ports. IP addresses on a stackable VLAN-enabled VLAN are not supported if the VLAN contains stackable VLAN access ports. This facility is provided for the simple network management protocol (SNMP) management over a stackable VLAN-enabled VLAN containing only stackable VLAN trunk interfaces. Layer 3 routing protocols on such a VLAN are not supported.
- Dell Networking recommends that you do not use the same MAC address, on different customer VLANs, on the same stackable VLAN.
- Interfaces configured using stackable VLAN access or stackable VLAN trunk commands do not switch traffic for the default VLAN. These interfaces are switch traffic only when they are added to a non-default VLAN.
- Starting with Dell Networking OS version 7.8.1 for C-Series and S-Series (Dell Networking OS version 7.7.1 for E-Series, 8.2.1.0 for E-Series ExaScale), a vlan-stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the vlan-stack trunk port is also a member of an untagged vlan, the port must be in Hybrid mode. Refer to [portmode hybrid](#).

## dei enable

Make packets eligible for dropping based on their DEI value.

**Syntax** `dei enable`

**Defaults** Packets are colored green; no packets are dropped.

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.3.1.0  | Introduced on the C-Series and S-Series. |

## dei honor

Honor the incoming DEI value by mapping it to an Dell Networking OS drop precedence. Enter the command once for 0 and once for 1.

**Syntax** `dei honor {0 | 1} {green | red | yellow}`

**Parameters**

|                             |                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0   1</b>                | Enter the bit value you want to map to a color.                                                                                                                                                                                                                                                                  |
| <b>green   red   yellow</b> | Choose a color: <ul style="list-style-type: none"><li>Green: High priority packets that are the least preferred to be dropped.</li><li>Yellow: Lower priority packets that are treated as best-effort.</li><li>Red: Lowest priority packets that are always dropped (regardless of congestion status).</li></ul> |

**Defaults** Disabled; Packets with an unmapped DEI value are colored green.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.3.1.0  | Introduced on the C-Series and S-Series. |

**Usage Information**

You must first enable DEI for this configuration to take effect.

## dei mark

Set the DEI value on egress according to the color currently assigned to the packet.

### S4820T

**Syntax**

```
dei mark {green | yellow} {0 | 1}
```

**Parameters**

|                             |                                                                                                                                                                                                                                    |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>0   1</b>                | Enter the bit value you want to map to a color.                                                                                                                                                                                    |
| <b>green   red   yellow</b> | Choose a color: <ul style="list-style-type: none"><li>• <b>Green</b>: High priority packets that are the least preferred to be dropped.</li><li>• <b>Yellow</b>: Lower priority packets that are treated as best-effort.</li></ul> |

**Defaults**

All the packets on egress are marked with DEI 0.

**Command Modes**

INTERFACE

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.3.1.0  | Introduced on the C-Series and S-Series. |

### Usage Information

You must first enable DEI for this configuration to take effect.

## member

Assign a stackable VLAN access or trunk port to a VLAN. The VLAN must contain the `vlan-stack compatible` command in its configuration.

### Syntax

`member interface`

To remove an interface from a Stackable VLAN, use the `no member interface` command.

### Parameters

#### *interface*

Enter the following keywords and slot/port or number information:

- For a Port Channel interface, enter the keywords `port-channel` then a number. The range is from 1 to 128.
- For a 10-Gigabit Ethernet interface, enter the keyword `TenGigabitEthernet` then the slot/port information.
- For a 40-Gigabit Ethernet interface, enter the keyword `fortyGigE` then the slot/port information.

### Defaults

Not configured.

### Command Modes

CONF-IF-VLAN

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                              |
|----------|------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.     |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |

**Usage Information**

You must enable the stackable VLAN (using the `vlan-stack compatible` command) on the VLAN prior to adding a member to the VLAN.

**Related Commands**

[vlan-stack compatible](#) — enables stackable VLAN on a VLAN.

## stack-unit stack-group

Configure a stacking group specified by an ID.

**Syntax** `[no] stack-unit unit-id stack-group stack-group-id`

**Parameters**

|                       |                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>unit-id</i>        | Enter the stack unit ID.                                                                                                   |
| <i>stack-group-id</i> | Enter the stack group ID. The range is from 0 to 16.                                                                       |
| [no]                  | Use <code>no stack-unit <i>unit-id</i> stack-group <i>stack-id</i></code> to remove the current stack group configuration. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.10.2 | Introduced on the S4810.    |

Usage  
Information

**WARNING:** The following message displays to confirm the command: All non-default configurations on the related member ports ports (<ports listed here>) will be removed. Do you want to continue (y/n)? If you enter "y", all non-default configurations on any member ports of the current stack group is removed when the unit is rebooted.

## vlan-stack access

Specify a Layer 2 port or port channel as an access port to the stackable VLAN network.

**Syntax**

`vlan-stack access`

To remove access port designation, use the `no vlan-stack access` command.

**Defaults**

Not configured.

**Command  
Modes**

INTERFACE

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.     |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |

**E-Series original  
Command**

**Usage  
Information**

Prior to enabling this command, to place the interface in Layer 2 mode, enter the `switchport` command.

To remove the access port designation, remove the port (using the `no member interface` command) from all stackable VLAN enabled VLANs.

# vlan-stack compatible

Enable the stackable VLAN feature on a VLAN.

**Syntax** `vlan-stack compatible`  
To disable the Stackable VLAN feature on a VLAN, use the `no vlan-stack compatible` command.

**Defaults** Not configured.

**Command Modes** CONF-IF-VLAN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.11.1 | Introduced on the Z9000.                 |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.2.1.0  | Introduced on the E-Series ExaScale.     |
| 7.6.1.0  | Introduced on the C-Series and S-Series. |

## E-Series original Command

**Usage Information** Prior to disabling the stackable VLAN feature, remove the members.

To view the stackable VLANs, use the `show vlan` command in EXEC Privilege mode. Stackable VLANs contain members, designated by the M in the Q column of the command output.

If VRF is enabled, then you cannot enable the stacked VLAN feature using this command.

If IGMP snooping is enabled, then you cannot enable the stacked VLAN feature using this command.

**Example**

```
Dell#show vlan
Codes: * - Default VLAN, G - GVRP VLANs
      NUM  Status  Q Ports
*    1    Inactive
```

```

2      Active      M Te 1/13
          M Te 1/1-3
3      Active      M Po1(Te 1/14-15)
          M Te 1/18
          M Te 1/4
4      Active      M Po1(Te 1/14-15)
          M Te 1/18
          M Te 1/5
5      Active      M Po1(Te 1/14-15)
          M Te 1/18
          M Te 1/6
Dell#

```

## vlan-stack dot1p-mapping

Map C-Tag dot1p values to a S-Tag dot1p value. You can separate the C-Tag values by commas and dashed ranges are permitted. Dynamic mode CoS overrides any Layer 2 QoS configuration in case of conflicts.

**Syntax** `vlan-stack dot1p-mapping c-tag-dot1p values sp-tag-dot1p value`

### Parameters

|                           |                                                                                                                                                      |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>c-tag-dot1p value</b>  | Enter the keyword <code>c-tag-dot1p</code> then the customer dot1p value that is mapped to a service provider dot1p value. The range is from 0 to 7. |
| <b>sp-tag-dot1p value</b> | Enter the keyword <code>sp-tag-dot1p</code> then the service provider dot1p value. The range is from 0 to 7.                                         |

**Defaults** none

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                              |
|----------|------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.              |
| 9.0.2.0  | Introduced on the S6000.                 |
| 8.3.19.0 | Introduced on the S4820T.                |
| 8.3.7.0  | Introduced on the S4810.                 |
| 8.3.1.0  | Introduced on the C-Series and S-Series. |

## vlan-stack protocol-type

Define the stackable VLAN tag protocol identifier (TPID) for the outer VLAN tag (also called the VMAN tag). If you do not configure this command, Dell Networking OS assigns the value 0x9100.

**Syntax** `vlan-stack protocol-type number`

**Parameters**

|               |                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | Enter the hexadecimal number as the stackable VLAN tag. You may specify both bytes of the 2-byte S-Tag TPID. The range is from 0 to FFFF. The default is <b>9100</b> . |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Defaults** 0x9100

**Command Modes** CONFIGURATION

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                            |
|----------|--------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                            |
| 9.0.2.0  | Introduced on the S6000.                                                                               |
| 8.3.19.0 | Introduced on the S4820T.                                                                              |
| 8.3.7.0  | Introduced on the S4810.                                                                               |
| 8.2.1.0  | Introduced on the E-Series ExaScale. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID. |
| 8.2.1.0  | Introduced on the E-Series ExaScale.                                                                   |
| 7.6.1.0  | Introduced on the C-Series and S-Series.                                                               |

**E-Series original Command**

**Usage Information** For specific interoperability limitations regarding the S-Tag TPID, refer to the *Dell Networking OS Configuration Guide*.

The four characters you enter in the CLI for number are interpreted, as shown in the following table.

| Number | Resulting TPID |
|--------|----------------|
| 1      | 0x0001         |
| 10     | 0x0010         |

| Number | Resulting TPID |
|--------|----------------|
| 81     | 0x0081         |
| 8100   | 0x8100         |

**Related  
Commands**

[portmode hybrid](#) — sets a port (physical ports only) to accept both tagged and untagged frames. A port configured this way is identified as a hybrid port in report displays.

[vlan-stack trunk](#) — specifies a Layer 2 port or port channel as a trunk port to the Stackable VLAN network.

## vlan-stack trunk

Specify a Layer 2 port or port channel as a trunk port to the Stackable VLAN network.

**Syntax**

`vlan-stack trunk`

To remove a trunk port designation from the selected interface, use the `no vlan-stack trunk` command.

**Defaults**

Not configured.

**Command  
History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                            |
|----------|--------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                            |
| 9.0.2.0  | Introduced on the S6000.                                                                               |
| 8.3.19.0 | Introduced on the S4820T.                                                                              |
| 8.3.11.1 | Introduced on the Z9000.                                                                               |
| 8.3.7.0  | Introduced on the S4810.                                                                               |
| 8.2.1.0  | Introduced on the E-Series ExaScale. C-Series and S-Series accept both bytes of the 2-byte S-Tag TPID. |
| 7.8.1.0  | Functionality augmented for C-Series and S-Series to enable multi-purpose use of the port.             |

| Version | Description                                                                   |
|---------|-------------------------------------------------------------------------------|
| 7.7.1.0 | Functionality augmented for E-Series to enable multi-purpose use of the port. |
| 7.6.1.0 | Introduced on the C-Series and S-Series.                                      |

### E-Series original Command

#### Usage Information

Prior to using this command, to place the interface in Layer 2 mode, execute the `switchport` command.

To remove the trunk port designation, first remove the port (using the `no member interface` command) from all stackable VLAN-enabled VLANs.

Starting with Dell Networking OS version 7.8.1.0, a VLAN-Stack trunk port is also allowed to be configured as a tagged port and as an untagged port for single-tagged VLANs. When the VLAN-Stack trunk port is also a member of an untagged VLAN, the port must be in Hybrid mode. Refer to [portmode hybrid](#).

In Example 1, a VLAN-Stack trunk port is configured and then also made part of a single-tagged VLAN.

In Example 2, the tag protocol identifier (TPID) is set to 8848. The “Gi 3/10” port is configured to act as a VLAN-Stack access port, while the “TenGi 8/0” port acts as a VLAN-Stack trunk port, switching stackable VLAN traffic for VLAN 10, while also switching untagged traffic for VLAN 30 and tagged traffic for VLAN 40. (To allow VLAN 30 traffic, the native VLAN feature is required, by executing the `portmode hybrid` command. Refer to [portmode hybrid](#) in Interfaces.

#### Example 1

```
Dell(conf-if-te-1/42)#switchport
Dell(conf-if-te-1/42)#vlan-stack trunk
Dell(conf-if-te-1/42)#show config
!
interface TenGigabitEthernet 1/42
  no ip address
  switchport
  vlan-stack trunk
  no shutdown
Dell(conf-if-te-1/42)#interface vlan 100

Dell(config)#interface vlan 40
Dell(conf-if-vlan)#tagged TenGi 5/1
Dell(conf-if-vlan)#exit
Dell(config)#

```

## Virtual Link Trunking (VLT)

Virtual link trunking (VLT) allows physical links between two chassis to appear as a single virtual link to the network core. VLT eliminates the requirement for Spanning Tree protocols by allowing link aggregation group (LAG) terminations on two separate distribution or core switches, and by supporting a loop-free topology.

VLT provides Layer 2 multipathing, creating redundancy through increased bandwidth and enabling multiple parallel paths between nodes and load-balancing traffic where alternative paths exist.

 **NOTE:** When you launch the VLT link, the VLT peer-ship is not established if any of the following is **TRUE**:

- The VLT System-MAC configured on both the VLT peers do not match.
- The VLT Unit-Id configured on both the VLT peers are identical.
- The VLT System-MAC or Unit-Id is configured only on one of the VLT peers.
- The VLT domain ID is not the same on both peers.

If the VLT peer-ship is already established, changing the System-MAC or Unit-Id does not cause VLT peer-ship to go down.

Also, if the VLT peer-ship is already established and the VLT Unit-Id or System-MAC are configured on both peers, then changing the CLI configurations on the VLT Unit-Id or System-MAC is rejected if any of the following become **TRUE**:

- After making the CLI configuration change, the VLT Unit-Id becomes identical on both peers.
- After making the CLI configuration change, the VLT System-MAC do not match on both peers.

When the VLT peer-ship is already established, you can remove the VLT Unit-Id or System-MAC configuration from either or both peers. However, removing configuration settings can cause the VLT ports to go down if you configure the Unit-Id or System-MAC on only one of the VLT peers.

## back-up destination

Configure the IPv4 or IPv6 address of the management interface on the remote VLT peer to be used as the endpoint of the VLT backup link for sending out-of-band hello messages.

**Syntax**                    `back-up destination {[ipv4-address] | [ipv6 ipv6-address]}  
[interval seconds]}`

**Parameters**            *ipv4-address*            Enter the IPv4 address of the backup destination.

|                         |                                                                                                                                                         |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ipv6</b>             | Enter the keyword <code>ipv6</code> then an IPv6 address in the X:X:X::X format.                                                                        |
| <b>interval seconds</b> | Enter the keyword <code>interval</code> to specify the time interval to send hello messages. The range is from 1 to 5 seconds. The default is 1 second. |

**Defaults**            **1 second**

**Command Modes**        VLT DOMAIN

**Command History**      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b> | <b>Description</b>                                                                                  |
|----------------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0)       | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1)       | Introduced on the Z9500.                                                                            |
| 9.2(0.0)       | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2)       | Added support for IPv6.                                                                             |
| 9.0.2.0        | Introduced on the S6000.                                                                            |
| 9.0.0.0        | Introduced on the Z9000.                                                                            |
| 8.3.19.0       | Introduced on the S4820T.                                                                           |
| 8.3.8.0        | Introduced on the S4810.                                                                            |

## clear vlt statistics

Clear the statistics on VLT operations.

**Syntax**                `clear vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]`

**Parameters**

|                   |                                               |
|-------------------|-----------------------------------------------|
| <b>domain</b>     | Clear the VLT statistics for the domain.      |
| <b>multicast</b>  | Clear the VLT statistics for multicast.       |
| <b>mac</b>        | Clear the VLT statistics for the MAC address. |
| <b>arp</b>        | Clear the VLT statistics for ARP.             |
| <b>igmp-snoop</b> | Clear the VLT statistics for IGMP snooping.   |

**ndp** Clear the VLT statistics for NDP.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2) | Added <code>multicast</code> and <code>ndp</code> parameters.                                       |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.0.0.0  | Introduced on the Z9000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Introduced on the S4810.                                                                            |

**Example**

```
VLT ARP Statistics
-----
ARP Tunnel Pkts sent:0
ARP Tunnel Pkts Rcvd:0
ARP-sync Pkts Sent:0
ARP-sync Pkts Rcvd:0
ARP Reg Request sent:19
ARP Reg Request rcvd:10
```

**Related Commands** [show vlt statistics](#) — displays statistics on VLT operations.

## delay-restore

Configure the delay in bringing up VLT ports after reload or peer-link restoration between the VLT peer switches.

**Syntax** `delay-restore`

**Parameters**

|                      |                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>delay-restore</b> | Enter the amount of time, in seconds, to delay bringing up the VLT ports after the VLTi device is reloaded or after the peer-link is restored between VLT peer switches. The range from 1 to 1200. The default is <b>90 seconds</b> . |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Defaults</b>          | Not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |         |             |          |                             |          |                          |          |                                                                                                     |         |                          |         |                          |          |                           |          |                          |

| <b>Usage Information</b> | <p>To delay the system from bringing up the VLT port for a brief period to allow IGMP Snooping and Layer 3 routing protocols to converge, use the <code>delay-restore</code> parameter. Use this feature:</p> <ul style="list-style-type: none"> <li>• after a VLT device is reloaded.</li> <li>• if the Peer VLT device was up at the time the VLTi link failed to the time when it was restored.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |         |             |          |                             |          |                          |          |                                                                                                     |         |                          |         |                          |          |                           |          |                          |
| <b>Related Commands</b>  | <a href="#">show vlt statistics</a> — displays statistics on VLT operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |         |             |          |                             |          |                          |          |                                                                                                     |         |                          |         |                          |          |                           |          |                          |

## delay-restore abort-threshold

Increase the Boot Up timer to some value (>60 seconds).

|                      |                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>        | <pre>delay-restore abort-threshold &lt;interval&gt;</pre> <p>To remove use the <code>no delay-restore abort-threshold</code> command.</p> |
| <b>Defaults</b>      | 60 seconds                                                                                                                                |
| <b>Command Modes</b> | VLT DOMAIN                                                                                                                                |

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                               |
|----------|---------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4820T, S4810, S6000, S5000, Z9000, S6000-ON and Z9500. |

**Parameter**

Enter the value (in seconds) to specify the time interval for delay restore timer to abort. This timer is applicable only during reload/boot-up and not in other scenarios (example, ICL flap).

The range is from 1 to 1800 seconds.

**Usage Information**

To abort VLT delay restore timer as the maximum threshold, the maximum time interval is applied to hold down ICL peer-up in the start-up configurations during the reload.

## lacp ungroup member-independent

Prevent possible loop during the bootup of a VLT peer switch or a device that accesses the VLT domain.

**Syntax**

```
lacp ungroup member-independent {vlt | port-channel}
```

**Parameters**

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <b>port-channel</b> | Force all LACP port-channel members to become switchports. |
| <b>vlt</b>          | Force all VLT LACP members to become switchports.          |

**Defaults**

Not configured.

**Command Modes**

CONFIGURATION

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |

| Version  | Description                                |
|----------|--------------------------------------------|
| 9.0.2.0  | Introduced on the S6000.                   |
| 9.0.0.0  | Introduced on the Z9000.                   |
| 8.3.19.0 | Introduced on the S4820T.                  |
| 8.3.12.0 | Added port-channel parameter on the S4810. |
| 8.3.8.0  | Introduced on the S4810.                   |

#### Usage Information

LACP on the VLT ports (on a VLT switch or access device), which are members of the virtual link trunk, is not brought up until the VLT domain is recognized on the access device.

On the S4810, during boot-up in a stacking configuration, the system must be able to reach the DHCP server with the boot image and configuration image. During boot-up, only untagged DHCP requests are sent to the DHCP server to receive an offer on static LAGs between switches. The DHCP server must be configured to start in BMP mode. If switches are connected using LACP port-channels like the VLT peer and Top of Rack (ToR), use the **port-channel** parameter on the ToR-side configuration to allow member ports of an ungrouped LACP port-channel to inherit vlan membership of that port channel to ensure untagged packets that are sent by a VLT peer device reach the DHCP server located on the ToR.

To ungroup the VLT and port-channel configurations, use the **no lacp ungroup member independent** command on a VLT port channel, depending on whether the port channel is VLT or non-VLT.

#### Example

```
Dell(conf)#lacp ungroup member-independent ?
port-channel          LACP port-channel members become
switchports
vlt                   All VLT LACP members
become switchports
```

## multicast peer-routing timeout

Configure the time for a VLT node to retain synced multicast routes or synced multicast outgoing interface (OIF) after a VLT peer node failure.

#### Syntax

```
multicast peer-routing timeout value
```

To restore the default value, use the `no multicast peer-routing timeout` command.

#### Parameters

**value** Enter the timeout value in seconds. The range is from 1 to 1200. The default is 150.

**Command Modes** VLT DOMAIN (conf-vlt-domain)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.                                                         |
| 9.0.2.0  | Introduced on the S6000.                                                                            |

## peer-link port-channel

Configure the specified port channel as the chassis interconnect trunk between VLT peers in the domain.

**Syntax** `peer-link port-channel port-channel-number {peer-down-vlan vlan id}`

**Parameters**

|                                             |                                                                                                                                           |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>port-channel-number</i></b>           | Enter the port-channel number that acts as the interconnect trunk. The range is from 1 to 128.                                            |
| <b><i>peer-down-vlan <i>vlan id</i></i></b> | Enter the keyword <code>peer-down-vlan</code> then a VLAN ID to configure the VLAN that the VLT peer link uses when the VLT peer is down. |

**Defaults** Not configured.

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.0.0.0  | Introduced on the Z9000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.12.0 | Added support for the <b>peer-down-vlan</b> parameter.                                              |
| 8.3.8.0  | Introduced on the S4810.                                                                            |

#### Usage Information

To configure the VLAN from where the VLT peer forwards packets received over the VLTi from an adjacent VLT peer that is down, use the **peer-down-vlan** parameter. When a VLT peer with bare metal provisioning (BMP) is booting up, it sends untagged DHCP discover packets to its peer over the VLTi. To ensure that the DHCP discover packets are forwarded to the VLAN that has the DHCP server, use this configuration.

## peer-routing

Enable L3 VLT peer-routing. This command is applicable for both IPV6/ IPV4.

|                        |                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>peer-routing</code><br>To disable L3 VLT peer-routing, use the <code>no peer-routing</code> command.                                                     |
| <b>Defaults</b>        | Disabled.                                                                                                                                                      |
| <b>Command Modes</b>   | VLT DOMAIN (conf-vlt-domain)                                                                                                                                   |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.4(0.0) | Added the support for IPV6 / IPV4.                                                                  |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.                                                         |

## peer-routing-timeout

Configure the delay after which peer routing is disabled when the peer is unavailable. This command is applicable for both IPV6/IPV4. If not configured, peer-routing will not be disabled at all even though the peer is unavailable.

**Syntax** `peer-routing-timeout value`  
To restore the default value, use the `no peer-routing-timeout` command.

**Parameters** **value** Enter the timeout value in seconds. The range is from 1 to 65535. The default value is infinity.

**Command Modes** VLT DOMAIN (conf-vlt-domain)

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                   |
|----------|---------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                   |
| 9.7(0.0) | Added support for default value on the S-Series and Z-Series. |
| 9.5(0.1) | Introduced on the Z9500.                                      |
| 9.4(0.0) | Added the support for IPV6 / IPV4.                            |
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.                   |
| 9.0.2.0  | Introduced on the S6000.                                      |

**Usage Information** When the timer expires, the software checks to see if the VLT peer is now available. If the VLT peer is not available, peer-routing is disabled on that peer.

## primary-priority

Assign the priority for master election among VLT peers.

**Syntax** `[no] primary-priority`

**Parameters** **value** To configure the primary role on a VLT peer, enter a lower value than the priority value of the remote peer. The range is from 1 to 65535.

| <b>Default</b>           | <b>32768</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |         |             |          |                             |          |                          |          |                                                                                                     |         |                          |          |                           |         |                          |

| <b>Usage Information</b> | <p>After you configure the VLT domain on each peer switch on both sides of the interconnect trunk, by default, the Dell Networking OS software elects a primary and secondary VLT peer device. To reconfigure the primary role of VLT peer switches, use the <code>priority</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                             |          |                          |          |                                                                                                     |         |                          |          |                           |         |                          |

## show vlt brief

Displays summarized status information about VLT domains currently configured on the switch.

| Version                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                             |          |                          |         |                          |
| 9.7(0.0)               | Introduced on the S6000-ON.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |         |             |          |                             |          |                          |         |                          |
| 9.5(0.1)               | Introduced on the Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                             |          |                          |         |                          |
| 9.0.2.0                | Introduced on the S6000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |         |             |          |                             |          |                          |         |                          |

| Version  | Description               |
|----------|---------------------------|
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.8.0  | Introduced on the S4810.  |

**Usage Information**

The version shown in the `show vlt brief` output command displays the VLT version number which is different from the Dell Networking OS version number. VLT version numbers are begin with odd numbers such as 3 or 5.

**Example (Brief)**

```
Dell#show vlt br
VLT Domain Brief
-----
Domain ID                : 1
Role                     : Secondary
Role Priority             : 32768
ICL Link Status          : Up
HeartBeat Status         : Up
VLT Peer Status          : Up
Version                  : 6(3)
Local System MAC address :
00:01:e8:8a:e9:91
Remote System MAC address :
00:01:e8:8a:e9:76
Remote system version    : 6(3)
Delay-Restore timer      : 90 seconds

Delay-Restore Abort Threshold : 60 seconds
Peer-Routing                : Disabled
Peer-Routing-Timeout timer  : 0 seconds
Multicast peer-routing timeout : 150 seconds
Dell#
```

## show vlt backup-link

Displays information on the backup link operation.

**Syntax** `show vlt backup-link`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description               |
|----------|---------------------------|
| 9.5(0.1) | Introduced on the Z9500.  |
| 9.0.2.0  | Introduced on the S6000.  |
| 9.0.0.0  | Introduced on the Z9000.  |
| 8.3.19.0 | Introduced on the S4820T. |
| 8.3.8.0  | Introduced on the S4810.  |

#### Example

```
Dell_VLTpeer1# show vlt backup-link

VLT Backup Link
-----
Destination:                10.11.200.18
Peer HeartBeat status:      Up
HeartBeat Timer Interval:   1
HeartBeat Timeout:         3
UDP Port:                   34998
HeartBeat Messages Sent:    1026
HeartBeat Messages Received: 1025
```

## show vlt counters

Displays the counter information.

**Syntax** `show vlt counters [arp| igmp-snoop | interface | mac | ndp]`

#### Parameters

|                   |                                                                                                          |
|-------------------|----------------------------------------------------------------------------------------------------------|
| <b>arp</b>        | Enter the keyword <code>arp</code> to display the ARP counter information for the VLT.                   |
| <b>igmp-snoop</b> | Enter the keywords <code>igmp-snoop</code> to display the igmp-snooping counter information for the VLT. |
| <b>interface</b>  | Enter the keyword <code>interface</code> to display the interface counter information for the VLT.       |
| <b>mac</b>        | Enter the keyword <code>mac</code> to display the MAC address counter information for the VLT.           |
| <b>ndp</b>        | Enter the keyword <code>ndp</code> to display the VLT counter information for NDP.                       |

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |

**Usage Information**

If you do not add a parameter such as `arp` or `mac`, the output displays all of the counters.

**Example**

```
Dell# show vlt counter
Total VLT counters
-----
L2 Total MAC-Address Count :
IGMP MRouter Vlans count :
IGMP Mcast Groups count :
ARP entries count :
```

**Example (igmp-snoop)**

```
Dell# show vlt counter igmp-snoop
Total IGMP VLT counters
-----
IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 5
```

**Example (igmp-snoop interface port-channel)**

```
Dell#show vlt counter igmp-snoop interface port-channel 2
VLT Port-ID: 2 IGMP Counter
-----
IGMP MRouter Vlans count : 0
IGMP Mcast Groups count : 5

Dell# show vlt counter igmp-snoop interface port-channel 100
VLT Port-ID: 100 IGMP Counter
-----
IGMP MRouter Vlans count : 1
IGMP Mcast Groups count : 0
Ve
```

**Example (NDP and Non-VLT ARP)**

```
Dell#show vlt counters
Total VLT Counters
-----
L2 Total MAC-Address Count:                2
Total Arp Entries Learnt :                  0
Total Arp Entries Synced :                  0
Total Non-VLT Arp entries Learnt:          0
Total Non-VLT Arp Entries Synced           0
IGMP MRouter Vlans count :                  0
IGMP Mcast Groups count :                   0
Total VLT Ndp Entries Learnt :              2
Total VLT Ndp Entries Synced :              0
Total Non-VLT Ndp Entries Learnt :          0
Total Non-VLT Ndp Entries Synced :          0
```

## show vlt detail

Displays detailed status information about VLT domains currently configured on the switch.

**Syntax** `show vlt detail`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.8.0  | Introduced on the S4810.    |

### Example

```
Dell# Dell(conf-if-vl-100)#show vlt detail
Local LAG Id Peer LAG Id Local Status Peer Status Active VLANs
-----
10          10          UP          UP          100, 200, 300,
400,
```

## show vlt inconsistency

Display run-time inconsistencies in the incoming interface (IIF) for spanned multicast routes.

**Syntax** `show vlt inconsistency ip mroute`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |

### Example

```
Dell#show vlt inconsistency ip mroute
Spanned Multicast Routing IIF Inconsistency
```

```

Multicast Route                               LocalIIF           PeerIIF
-----
(22.22.22.200, 225.1.1.2)                     VLAN 5            VLAN 6
(*, 225.1.1.2)                               VLAN 15           te 1/5
Dell#
```

## show vlt mismatch

Display mismatches in VLT parameters.

**Syntax** `show vlt mismatch`

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

### Version

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.7(0.0) | Introduced the support for Q-in-Q implementation over VLT on the S-Series and Z-Series.             |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.2) | Introduced on the Z9000, S4810, and S4820T.                                                         |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |

**Example**

```

Dell#show vlt mismatch
Domain
-----
Parameters      Local      Peer
-----
Unit-ID         0         1

Vlan-config
-----
Vlan-ID         Local Mode      Peer Mode
-----
100             --             L3

Vlan IPv4 Multicast Status
-----
Vlan-ID         Local Status      Peer Status
-----
4094            Active            Inactive

Dell#

```

**Example for Q-in-Q implementation over VLT**

```

Dell#show vlt mismatch
Domain
-----
Parameters      Local      Peer
-----
PB for stp      Enabled    Disabled

Vlan-type-config
-----
Codes:: P - Primary, C - Community, I - Isolated, N - Normal
vlan, M - Vlan-stack

Vlan-ID         Local      Peer
-----
100             N         M

Port-type-config
-----
Codes:: p - PVLAN Promiscuous port, h - PVLAN Host port, t -
PVLAN Trunk port,
mt - Vlan-stack trunk port, mu - Vlan-stack access
port, n - Normal port

Vlt Lag         Local      Peer
-----
128             mt         mu

Vlan-stack protocol-type
-----

Local      Peer
-----
0x4100     0x8100

VLT-VLAN config
-----

Local Lag      Peer Lag      Local VLANs      Peer VLANs

```

```

-----
128          128          4094          100
-----
Dell#

```

## show vlt role

Displays the VLT peer status, role of the local VLT switch, VLT system MAC address and system priority, and the MAC address and priority of the local VLT device.

**Syntax**                    show vlt role

**Default**                    Not configured.

**Command Modes**            EXEC

**Command History**           This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.8.0  | Introduced on the S4810.    |

### Example

```

Dell_VLTpeer1# show vlt role

VLT Role
-----
VLT Role: Primary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768
Local System MAC address: 00:01:e8:8a:df:bc
Local System Role Priority: 32768

Dell_VLTpeer2# show vlt role

VLT Role
-----
VLT Role: Secondary
System MAC address: 00:01:e8:8a:df:bc
System Role Priority: 32768

```

Local System MAC address: 00:01:e8:8a:df:e6  
Local System Role Priority: 32768

## show vlt statistics

Displays statistics on VLT operations.

**Syntax** `show vlt statistics [arp | domain | igmp-snoop | mac | multicast | ndp]`

**Parameters**

|                   |                                                 |
|-------------------|-------------------------------------------------|
| <b>domain</b>     | Display the VLT statistics for the domain.      |
| <b>multicast</b>  | Display the VLT statistics for multicast.       |
| <b>mac</b>        | Display the VLT statistics for the MAC address. |
| <b>arp</b>        | Display the VLT statistics for ARP.             |
| <b>igmp-snoop</b> | Display the VLT statistics for IGMP snooping.   |
| <b>ndp</b>        | Display the VLT statistics for NDP.             |

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                  |
|----------|--------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                  |
| 9.5(0.1) | Introduced on the Z9500.                                     |
| 9.2(0.2) | Added parameters <code>multicast</code> and <code>ndp</code> |
| 9.0.2.0  | Introduced on the S6000.                                     |
| 9.0.0.0  | Introduced on the Z9000.                                     |
| 8.3.19.0 | Introduced on the S4820T.                                    |
| 8.3.12.0 | Added support in the output for ARP, MAC, and IGMP snooping. |
| 8.3.8.0  | Introduced on the S4810.                                     |

**Related Commands** [clear vlt statistics](#) — clears the statistics on VLT operations.

## Example

**NOTE:** The following example shows the statistics for *all* of the VLT parameters. If you enter a specific keyword, such as `mac`, only the statistics for that VLT parameter displays.

```
Dell VLTpeer1#show vlt statistics
VLT Statistics
-----
HeartBeat Messages Sent:      930
HeartBeat Messages Received: 909
ICL Hello's Sent:             927

## show vlt statistics igmp-snoop

Displays the informational packets and IGMP control PDUs that are exchanged between VLT peer nodes.

**Syntax** `show vlt statistics igmp-snoop`

**Default** Not configured.

**Command Modes** EXEC

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.12.0 | Introduced on the S4810.    |

### Example

```
Dell VLTpeer1#show vlt statistics igmp-snoop
VLT Igmp-Snooping Statistics
-----
IGMP Info Pkts sent:      4
IGMP Info Pkts Rcvd:     1

IGMP PDU Tunnel Pkt rcvd:10
IGMP Tunnel PDUs sent:   10
IGMP Tunnel PDUs rcvd:   19
```

## system-mac

Reconfigure the default MAC address for the domain.

**Syntax** `system-mac mac-address`

**Parameters** **mac-address** Enter the system MAC address for the VLT domain.

**Defaults** Not configured.

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.0.0  | Introduced on the Z9000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.8.0  | Introduced on the S4810.                                                                            |

**Usage Information** When you create a VLT domain on a switch, Dell Networking OS automatically creates a VLT-system MAC address used for internal system operations.

To reconfigure the default MAC address for the domain by entering a new MAC address in the format nn:nn:nn:nn:nn:nn, use the `system-mac` command.

You must also reconfigure the same MAC address on the VLT peer switch.

## unit-id

Explicitly configure the default unit ID of a VLT peer switch.

**Syntax** `unit-id [0 | 1]`

**Parameters** **0 | 1** Configure the default unit ID of a VLT peer switch. Enter 0 for the first peer or enter 1 for the second peer.

**Defaults** Automatically assigned based on the MAC address of each VLT peer. The peer with the lower MAC address is assigned unit 0; the peer with the higher MAC address is assigned unit 1.

**Command Modes** VLT DOMAIN

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                         |
| 9.5(0.1) | Introduced on the Z9500.                                                                            |
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.0.0.0  | Introduced on the Z9000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.8.0  | Introduced on the S4810.                                                                            |

### Usage Information

When you create a VLT domain on a switch, Dell Networking OS automatically assigns a unique unit ID (0 or 1) to each peer switch. The unit IDs are used for internal system operations. Use the `unit-id` command to explicitly configure the unit ID of a VLT peer. Configure a different unit ID (0 or 1) on each peer switch.

To minimize the time required for the VLT system to determine the unit ID assigned to each peer switch when one peer reboots, use this command.

## vlt domain

Enable VLT on a switch, configure a VLT domain, and enter VLT-domain configuration mode.

### Syntax

```
vlt domain domain-id
```

### Parameters

**domain-id** Enter the Domain ID number. Configure the same domain ID on the peer switch. The range of domain IDs is from 1 to 1000.

### Command Modes

CONFIGURATION

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |
| 9.0.2.0  | Introduced on the S6000.                                                                            |
| 9.0.0.0  | Introduced on the Z9000.                                                                            |
| 8.3.19.0 | Introduced on the S4820T.                                                                           |
| 8.3.8.0  | Introduced on the S4810.                                                                            |

**Usage Information**

The VLT domain ID must be the same between the two VLT devices. If the domain ID is not the same, a syslog message is generated and VLT does not launch.

**Related Commands**

[show vlt](#) – uses the `show vlt brief` command to display the delay-restore value.

## vlt-peer-lag port-channel

Associate the port channel to the corresponding port channel in the VLT peer for the VLT connection to an attached device.

**Syntax** `vlt-peer-lag port-channel id-number`

**Parameters**

*id-number* Enter the respective vlt port-channel number of the peer device. The range is from 1 to 128.

**Defaults** Not configured.

**Command Modes** INTERFACE PORT-CHANNEL

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.5(0.1) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.8.0  | Introduced on the S4810.    |

| Version  | Description                                                                                         |
|----------|-----------------------------------------------------------------------------------------------------|
| 9.2(0.0) | Introduced on the M I/O Aggregator. This command is supported in Programmable-Mux (PMUX) mode only. |

## show vlt private-vlan

Display the private VLAN (PVLAN) associated with the VLT LAG for VLT peer nodes.

**Syntax** `show vlt private-vlan`

**Command Modes** EXEC

| Command History | Version  | Description                                 |
|-----------------|----------|---------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                 |
|                 | 9.5(0.1) | Introduced on the Z9500.                    |
|                 | 9.4(0.0) | Introduced on the S6000.                    |
|                 | 9.3(0.0) | Introduced on the Z9000, S4810, and S4820T. |

**Usage Information** If you add an ICL or VLTi link as a member of a primary VLAN, the ICL becomes a part of the primary VLAN and its associated secondary VLANs, similar to the behavior for normal trunk ports. VLAN symmetry is not validated if you associate an ICL to a PVLAN. Similarly, if you dissociate an ICL from a PVLAN, although the PVLAN symmetry exists, ICL is removed from that PVLAN in such a case. The **ICL Status** field denotes the type of the VLAN port of the VLTi link configured in a PVLAN.

**Example**

```
Dell#show vlt private-vlan vlan-id

Codes: C- Community, I - Isolated, V - Internally tagged, T -
tagged, * - VLT Pvlan
Primary   Secondary   ICL Status
10                20 (C)       V
                30 (I)       V

40                50 (C)       T
                60 (I)       T
```

# VLT Proxy Gateway

The Virtual link trucking (VLT) proxy gateway feature allows a VLT domain to locally terminate and route L3 packets that are destined to a Layer 3 (L3) end point in another VLT domain. Enable the VLT proxy gateway using the link layer discover protocol (LLDP) method or the static configuration. For more information, refer to *Dell Networking OS Command Line Reference Guide*.

## proxy-gateway lldp

Enables the proxy-gateway feature using LLDP protocol.

### S4820T

|                          |                                                                                                                                                                                                                                                                                                                                                        |                                                    |

| <b>Command History</b>   | <b>Version</b>                                                                                                                                                                                                                                                                                                                                         | <b>Description</b>                                 |
|                          | 9.7(0.0)                                                                                                                                                                                                                                                                                                                                               | Introduced on the S6000-ON.                        |
|                          | 9.4(0.0)                                                                                                                                                                                                                                                                                                                                               | Introduced on the S4810, S4820T, S6000, and Z9000. |
| <b>Usage Information</b> | <p>The configuration is cached and sent to LLDP only in one of the following conditions:</p> <ol style="list-style-type: none"> <li>1) The port-channel connecting the two VLT domains, across DC, must be a VLT LAG</li> <li>2) The protocol lldp command is globally enabled</li> <li>3) The proxy-gateway LLDP configuration is applied.</li> </ol> |                                                    |
| <b>Example</b>           | <pre>Dell(conf)#vlt-domain 1 Dell(conf-vlt-domain)#proxy-gateway lldp</pre>                                                                                                                                                                                                                                                                            |                                                    |

## proxy-gateway static

Enables the proxy-gateway feature using static configurations.

### S4820T

**Syntax** [no] proxy-gateway static

**Command Modes** VLT DOMAIN

| Command History | Version  | Description                                    |
|-----------------|----------|------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                    |
|                 | 9.4(0.0) | Introduced on the S4810, S4820T, S6000, Z9000. |

**Usage Information** When proxy-gateway static configuration is added, the setting is saved in the Layer 2 module. When you remove the static proxy gateway configuration, each proxy-gateway static mac configured is deleted from the Layer 2 module.

**Example**  
Dell(conf)#vlt-domain 1  
Dell(conf-vlt-domain)#proxy-gateway static

## remote-mac-address exclude-vlan

Configure the proxy-gateway static entry and exclude a VLAN or a range of VLANs from proxy routing.

### S4820T

**Syntax** [no] remote-mac-address mac-address [exclude-vlan vlan-range]

| Parameters                |                                                                                                                                                                                                                                                                                    |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>remote-mac-address</b> | Specify the mac-addresses of the VLT peers which are in the remote VLT Domain.                                                                                                                                                                                                     |
| <b>mac-address</b>        | Enter the 48-bit hexadecimal address in nn:nn:nn:nn:nn:nn format.                                                                                                                                                                                                                  |
| <b>vlan-range</b>         | Enter the VLAN IDs in which proxy gateway is not needed. The VLANs are excluded from doing proxy gateway. The value can be a single VLAN ID or comma -separated, VLAN IDs or a range of VLAN IDs or a combination. For example:<br><br>Comma-separated: 3, 4, 6<br><br>Range: 5-10 |

Combination: 3, 4, 5-10, 8

|                          |                                                                                                                                                                                       |                                                    |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Command Modes</b>     | VLT DOMAIN PROXY GW STATIC                                                                                                                                                            |                                                    |
| <b>Command History</b>   | <b>Version</b>                                                                                                                                                                        | <b>Description</b>                                 |
|                          | 9.7(0.0)                                                                                                                                                                              | Introduced on the S6000-ON.                        |
|                          | 9.4(0.0)                                                                                                                                                                              | Introduced on the S4810, S4820T, S6000, and Z9000. |
| <b>Usage Information</b> | You can configure the MAC address, of a VLT peer in remote VLT Domain, to be associated with the static VLT proxy gateway and exclude a VLAN or a range of VLANs from proxy routing.. |                                                    |
| <b>Example</b>           | <pre>Dell(conf)#vlt-domain 1 Dell(conf-vlt-domain)#proxy-gateway static Dell(conf-vlt-domain-proxy-gw-static)#remote-mac-address 00:01:e8:06:95:ac exclude-vlan 3</pre>               |                                                    |

## peer-domain-link port-channel exclude-vlan

Configure the VLT port channel, which is connected to remote VLT domain for Proxy Gateway and configure the VLANs that needs to be excluded from VLT Proxy Gateway.

### S4820T

|                   |                                                                                                          |                                                                                                                                                                                                                                                                                                                     |
|-------------------|----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <pre>[no] peer-domain-link port-channel <i>interface-identifier</i> exclude-vlan <i>vlan-range</i></pre> |                                                                                                                                                                                                                                                                                                                     |

|                          | 9.5(0.1)                                                                                                                                                                                  | Introduced on the Z9500.                           |
|                          | 9.4(0.0)                                                                                                                                                                                  | Introduced on the S4810, S4820T, S6000, and Z9000. |
| <b>Usage Information</b> | The VLT port channel interface which is connecting to the remote VLT domain must be configured as peer-domain-link. Configure the VLANs that needs to be excluded from VLT Proxy Gateway. |                                                    |
| <b>Example</b>           | <pre>Dell(conf)#vlt-domain 1 Dell(conf-vlt-domain)#proxy-gateway lldp Dell(conf-vlt-domain-proxy-gw-lldp)#peer-domain-link port-channel 20 exclude-vlan 3</pre>                           |                                                    |

## proxy-gateway peer-timeout

Enables the VLT node to timeout the transmission of peer's mac address, when the VLT peer is down.

### S4820T

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>Syntax</b>            | <code>[no] peer-timeout value</code>                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                   |
| <b>Parameters</b>        | <b>value</b>                                                                                                                                                                                                                                                                                                                                                                                                                                | Enter the timeout value in seconds. The range is from 1 to 65535. |
| <b>Command Modes</b>     | VLT DOMAIN PROXY GW LLDP                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                   |

|                          | 9.7(0.0)                                                                                                                                                                                                                                                                                                                                                                                                                                    | Removed the default value on the S-Series and Z-Series.           |
|                          | 9.4(0.0)                                                                                                                                                                                                                                                                                                                                                                                                                                    | Introduced on the S4810, S4820T, S6000, Z9000, and MXL Switch.    |
| <b>Usage Information</b> | When a VLT peer goes down, the local VLT node must stop sending its peer's MAC address. If this timeout is configured, the local VLT node will send its peer's MAC address, till the timer expires. By default this timer value is infinity. This timer comes into play, only when the vlt-peer-mac transmit is enabled. Square VLT Topology with single link connecting to the remote peers, is a typical use case for this configuration. |                                                                   |

**Example** `Dell(conf-vlt-domain-proxy-gw-lldp)# peer-timeout 5`

## vlt-peer-mac transmit

Enables the device to transmit, the peer's MAC address along with its own mac-address in the LLDP TLV packets, to the remote VLT Domain.

### S4820T

**Syntax** `[no] vlt-peer-mac transmit`

**Command Modes** VLT DOMAIN PROXY GW LLDP

| Command History | Version  | Description                                        |
|-----------------|----------|----------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S6000-ON.                        |
|                 | 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information** This command enables the device to transmit its VLT peer's MAC address along with its own MAC address to the remote VLT domain. By default, a node will send only its own MAC address to the remote VLT domain. This configuration is applicable only for a LLDP proxy gateway. Square VLT Topology with single link connecting to the remote peers, is a typical use case for this configuration.

**Example** `Dell(conf-vlt-domain-proxy-gw-lldp)# vlt-peer-mac transmit`

## show vlt-proxy-gateway

Display the VLT proxy gateway configuration.

### S4820T

**Syntax** `show vlt-proxy-gateway [info] {lldp | static}`

| Parameters |               |                                                                  |
|------------|---------------|------------------------------------------------------------------|
|            | <b>lldp</b>   | Display details about the LLDP VLT proxy gateway configuration   |
|            | <b>static</b> | Display details about the static VLT proxy gateway configuration |

**Command Modes**

EXEC  
EXEC Privilege

**Command History**

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                        |
| 9.4(0.0) | Introduced on the S4810, S4820T, S6000, and Z9000. |

**Usage Information**

At any point of time the proxy-gateway feature may go operationally down for the following reasons,

- 1) LLDP globally disabled
- 2) LLDP disabled per port
- 3) VLT port-channel is down
- 4) LLDP neighbor down

So, the proxy-gateway feature could be operationally down though properly configured and this will be reported in the "show command".

When more than one VLT port-channel terminates on the same TOR, output of the `show VLT proxy-gateway info lldp` command may show the port-channel id incorrectly.

**Example**

```
Dell#show vlt proxy-gateway
 VLT Proxy Gateway Brief
-----
 Config Mode:                               LLDP
 Global LLDP Config Status:                 Enabled
 peer-mac-transmit Status:                  Disabled

Dell#show vlt proxy-gateway info static
Mac Address          Exclude Vlan
-----
00:01:e8:8a:e8:f7    3,7-8
00:01:e8:8b:1c:c0    3,7-8

Dell#show vlt proxy-gateway info lldp
LagId Mac Address      Exclude Vlan
-----
Po 55 00:01:e8:8a:e8:f7 3,7-8 << Macs learnt via port-channel
55
Po 55 00:01:e8:8b:1c:c0 3,7-8
```

# Virtual Routing and Forwarding (VRF)

Virtual Routing and Forwarding (VRF) allows multiple instances of a routing table to co-exist on the same router at the same time.

## ip vrf

Creates a customer VRF.

| <b>Syntax</b>            | <code>ip vrf {vrf-name   management} [vrf_id]</code><br>To delete a customer VRF, use the <code>no ip vrf {vrf-name   management} [vrf_id]</code> command.                                                                                                                                                                                                                                                                                                                                                                |         |             |          |                                       |          |                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|-------------|----------|---------------------------------------|----------|-------------------------------------|
| <b>Parameters</b>        | <p><b>vrf-name</b> Enter the name of the VRF that you want to create.</p> <p><b>management</b> Use this keyword when you want to create the management VRF.</p> <p><b>vrf_id</b> Enter the ID of the VRF that you want to create.</p>                                                                                                                                                                                                                                                                                     |         |             |          |                                       |          |                                     |
| <b>Defaults</b>          | Available by default for management VRF. For creating other customer VRFs, the <i>feature vrf</i> option in config mode must be enabled.                                                                                                                                                                                                                                                                                                                                                                                  |         |             |          |                                       |          |                                     |
| <b>Command Modes</b>     | CONFIG                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |         |             |          |                                       |          |                                     |

| Version                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |         |             |          |                                       |          |                                     |
| 9.7(0.0)                 | Introduced on the S6000–ON and Z9500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |         |             |          |                                       |          |                                     |
| 9.4(0.0)                 | Introduced on the S4810 and S4820T.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |             |          |                                       |          |                                     |
| <b>Usage Information</b> | Use this command to create or delete a customer VRF. You cannot use the keyword <code>default</code> as a VRF name as it indicates a special VRF. Use the keyword <code>management</code> to create a management VRF. You need not provide a VRF ID while                                                                                                                                                                                                                                                                 |         |             |          |                                       |          |                                     |

creating a management VRF. For other types of VRFs, VRF ID is an optional parameter. All values in the valid range that are not already taken are allowed.

## ip http vrf

Configures an HTTP client with a VRF that is used to connect to the HTTP server.

### S4820T

| <b>Syntax</b>            | <code>ip http vrf {management   vrf-name}</code><br>To undo the HTTP client configuration, use the <code>ip http vrf</code> command.                                                                                                                                                                                                                                                                                                                                    |                   |                                                                                                        |                 |                                                                                  |

| <b>9.8(0.0)</b>          | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500.                                                                                                                                                                                                                                                                                                                                                                                                     |                   |                                                                                                        |                 |                                                                                  |
| <b>Usage Information</b> | To make the HTTP clients VRF-aware, use the <code>ip http vrf</code> command. The HTTP client uses the VRF name that you specify to reach the HTTP server. If you do not specify a VRF name, then the HTTP client uses the default VRF.                                                                                                                                                                                                                                 |                   |                                                                                                        |                 |                                                                                  |

## description

Enables you to specify a descriptive name for a customer VRF.

|               |                                 |
|---------------|---------------------------------|
| <b>Syntax</b> | <code>description string</code> |
|---------------|---------------------------------|

To delete the descriptive name for a customer VRF, use the `no description string` command.

|                          |                                                                                                                                                                |                                       |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| <b>Parameters</b>        | <b>string</b>                                                                                                                                                  | Enter a descriptive name for the VRF. |
| <b>Defaults</b>          | None.                                                                                                                                                          |                                       |
| <b>Command Modes</b>     | VRF MODE                                                                                                                                                       |                                       |
| <b>Command History</b>   | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                       |
|                          | The following is a list of the Dell Networking OS version history for this command.                                                                            |                                       |
|                          | <b>Version</b>                                                                                                                                                 | <b>Description</b>                    |
|                          | 9.7(0.0)                                                                                                                                                       | Introduced on the S6000-ON.           |
|                          | 9.5(0.0)                                                                                                                                                       | Introduced on the Z9500.              |
|                          | 9.4.(0.0)                                                                                                                                                      | Introduced on the S-Series.           |
| <b>Usage Information</b> | Use this command to specify a descriptive name for a VRF.                                                                                                      |                                       |

## ip vrf forwarding

Enables you to attach an interface to a VRF.

**Syntax** `ip vrf forwarding {vrf-name | management}`  
To delete an interface associated with a configured VRF, use the `no ip vrf forwarding {vrf-name | management} command`.

|                        |                                                                                                                                                                |                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Parameters</b>      | <b>vrf-name</b>                                                                                                                                                | Enter name of the VRF that you want to associate the interface to.               |
|                        | <b>management</b>                                                                                                                                              | Use this keyword when you want to associate the interface to the management VRF. |
| <b>Defaults</b>        | None (Interface is part of default VRF).                                                                                                                       |                                                                                  |
| <b>Command Modes</b>   | INTERFACE-CONFIG                                                                                                                                               |                                                                                  |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                  |
|                        | The following is a list of the Dell Networking OS version history for this command.                                                                            |                                                                                  |

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON and Z9500. |
| 9.4.(0.0) | Introduced on the S-Series and Z9000. |

### Usage Information

Use this command to attach an interface to a configured VRF. You can attach an interface to either a non-default VRF or a management VRF. To assign a port-back to a default VRF, remove VRF association from the interface. You can use this only if there is no IP address configured on the interface.

There must be no prior Layer 3 configuration on the interface when configuring VRF.

VRF must be enabled prior to implementing this command.

You can configure an IP subnet or address on a physical or VLAN interface that overlaps the same IP subnet or address configured on another interface only if the interfaces are assigned to different VRFs. If two interfaces are assigned to the same VRF, you cannot configure overlapping IP subnets or the same IP address on them.

### Example

```
Dell#configure terminal
Dell(conf)#ip vrf red
Dell(conf-vrf)#description "Red Network"
Dell(conf-vrf)#show config
!
ip vrf red 4
description "Red Network"
Dell(conf-vrf)#

Dell(conf-if-te-1/45)#int te 7/46
Dell(conf-if-te-1/46)#no shut
Dell(conf-if-te-1/46)#ip vrf forwarding red
Dell(conf-if-te-1/46)#ip add 100.1.1.1/24
Dell(conf-if-te-1/46)#
Dell(conf-if-te-1/46)#
Dell(conf-if-te-1/46)#
Dell(conf-if-te-1/46)#show config
!
interface TenGigabitEthernet 1/46
ip vrf forwarding red
ip address 100.1.1.1/24
no shutdown
Dell(conf-if-te-1/46)#
```

## ip route-export

Enables route leaking between VRFs. Exports or shares IPv4 routes corresponding to one VRF with other non-default VRFs.

**Syntax** `ip route-export tag [route-map-name]`

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                            |

This tag acts as an identifier for exported routes. You can use this identifier while importing these routes into another non-default VRF.                                                                                                                                                                                                               |
|                          | <b>route-map-name</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | (Optional) Enter the name of the route-map to filter the exported routes.<br><br>You can leak global routes to be made available to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes will be duplicated into the VRF's RTM. As a result, it is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs. |

| <b>Usage Information</b> | <p>You can use the ip route-export tag command without specifying the route-map attribute to export all the routes corresponding to a source VRF. This action exposes source VRF's routes to various other VRFs, which then import these routes using the ip route-import tag command. In Dell Networking OS, you can configure at most one route-export per VRF as only one set of routes can be exposed for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.</p> <p>You can expose a unique set of routes from the Source VRF for Leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. Meaning, you cannot import one set of routes from one VRF and another set of routes from another VRF.</p> <p>Only Active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the Target VRF has specified filtering options to match BGP, the BGP route is not leaked as that route is not active in the Source VRF.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                            |

# ip route-import

Imports IPv4 routes that are leaked by another VRF using the tag specified by that VRF during export of these routes.

**Syntax** `ip route-import tag [route-map-name]`

## Parameters

|                       |                                                                                                                                                                                                                                                 |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>route-import</b>   | Enter the keyword <code>route-import</code> to import routes into the VRF.                                                                                                                                                                      |
| <b>tag</b>            | Enter a tag (ASN number) to specify an import route target for importing routes from another VRF.<br>To import leaked routes from another VRF, you must use the same ASN number that is specified as the export route target at the source VRF. |
| <b>route-map-name</b> | Enter the name of the route-map to filter the imported routes.                                                                                                                                                                                  |

**NOTE:** You must use the route-map attribute while importing routes from the global RTM. Route-maps enable you to filter routes at the import end based on the matching criteria that you define in the route-map.

**Defaults** N/A

**Command Modes** CONFIGURATION

VRF MODE

## Command History

| Version  | Description                                                         |
|----------|---------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

## Usage Information

It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.

## Related Commands

[ip route-export](#) – exports routes to another VRF.

## ipv6 route-export

Enables route leaking between VRFs. Exports or shares IPv6 routes corresponding to one VRF with other non-default VRFs.

**Syntax** `ipv6 route-export tag [route-map-name]`

|                   |                       |                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Parameters</b> | <b>route-export</b>   | Enter the keyword route-export to leak or share routes between VRFs.                                                                                                                                                                                                                                                                                                                                                |
|                   | <b>tag</b>            | Enter a tag (ASN number) as the export route target to expose routes to other VRFs. This tag acts as an identifier for exported routes. You can use this identifier while importing these routes into another non-default VRF.                                                                                                                                                                                      |
|                   | <b>route-map-name</b> | (Optional) Enter the name of the route-map to filter the exported routes. You can leak global routes to be made available to VRFs. As the global RTM usually contains a large pool of routes, when the destination VRF imports global routes, these routes will be duplicated into the VRF's RTM. As a result, it is mandatory to use route-maps to filter out leaked routes while sharing global routes with VRFs. |

**Defaults** N/A

CONFIGURATION

|                        |                |                                                                     |
|------------------------|----------------|---------------------------------------------------------------------|
| <b>Command History</b> | <b>Version</b> | <b>Description</b>                                                  |
|                        | 9.7(0.0)       | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage Information**  
You can use the ip route-export tag command without specifying the route-map attribute to export all the routes corresponding to a source VRF. This action exposes source VRF's routes to various other VRFs, which then import these routes using the ip route-import tag command. In Dell Networking OS, you can configure at most one route-export per VRF as only one set of routes can be exposed for leaking. However, you can configure multiple route-import targets because a VRF can accept routes from multiple VRFs.

You can expose a unique set of routes from the Source VRF for Leaking to other VRFs. When two VRFs leak or export routes, there is no option to discretely filter leaked routes from each source VRF. Meaning, you cannot import one set of routes from one VRF and another set of routes from another VRF.

Only Active routes are eligible for leaking. For example, if one VRF has two routes corresponding to BGP and OSPF, in which the BGP route is not active, the OSPF route takes precedence over BGP. Even though the Target VRF has specified

filtering options to match BGP, the BGP route is not leaked as that route is not active in the Source VRF.

**Related  
Commands**

[ipv6 route-import](#) – imports IPv6 routes from another VRF.

## ipv6 route-import

Imports IPv6 routes that are leaked by another VRF using the tag specified by that VRF during export of these routes.

**Syntax**

```
ipv6 route-import tag [route-map-name]
```

**Parameters**

**route-import** Enter the keyword `route-import` to import IPv6 routes into the VRF.

**tag** Enter a tag (ASN number) to specify an import route target for importing routes from another VRF. To import leaked routes from another VRF, you must use the same ASN number that is specified as the export route target at the source VRF.

***route-map-name*** Enter the name of the route-map to filter the imported routes.

**NOTE:** You must use the route-map attribute while importing routes from the global RTM. Route-maps enable you to filter routes at the import end based on the matching criteria that you define in the route-map.

**Defaults**

N/A

|----------|---------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, S6000-ON, and Z9500. |

**Usage  
Information**

It is possible to configure multiple import conditions per VRF depending on the exporting VRF.

The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.

**Related Commands**      [ipv6 route-export](#) – exports IPv6 routes to another VRF.

## match source-protocol

Enables you to specify matching criteria while exporting or importing routes.

**Syntax**                    `match source-protocol {bgp | isis | ospf | connected | static}`

| Parameters       |  |                                                                                         |
|------------------|--|-----------------------------------------------------------------------------------------|
| <b>bgp</b>       |  | Enter the keyword bgp to leak or share routes corresponding to the BGP protocol.        |
| <b>isis</b>      |  | Enter the keyword isis to leak or share routes corresponding to the ISIS protocol.      |
| <b>ospf</b>      |  | Enter the keyword ospf to leak or share routes corresponding to the OSPF protocol.      |
| <b>connected</b> |  | Enter the keyword connected to leak or share connected routes corresponding to the VRF. |
| <b>static</b>    |  | Enter the keyword static to leak or share static routes corresponding to the VRF.       |

**Defaults**                    N/A

**Command Modes**            ROUTE MAP MODE

| Command History | Version  | Description                                                         |
|-----------------|----------|---------------------------------------------------------------------|
|                 | 9.7(0.0) | Introduced on the S4810, S4820T, S5000, S6000, S6000–ON, and Z9500. |

**Usage Information**        You can specify the matching criteria only after defining a route-map. Before using this command, you must enter the route map mode using the route-map route-map-name command. The match criteria that you specify is associated with the route-map that you define.

The export-target and import-target support only the match protocol and match prefix-list options. Other options that are configured in the route-maps are ignored.

**Related Commands**      [ipv6 route-import](#) – imports IPv6 routes from another VRF.

## redistribute

Redistributes leaked or exported routes corresponding to specific protocols.

|                         |                                                                      |                                                                                                                     |
|-------------------------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>           | <code>redistribute {imported-bgp   import-ospf   import-isis}</code> |                                                                                                                     |
| <b>Parameters</b>       | <b>imported-bgp</b>                                                  | Enter the keyword <code>imported-bgp</code> to redistribute leaked routes that are learnt using the BGP protocol.   |
|                         | <b>imported-ospf</b>                                                 | Enter the keyword <code>imported-ospf</code> to redistribute leaked routes that are learnt using the OSPF protocol. |
|                         | <b>imported-isis</b>                                                 | Enter the keyword <code>imported-isis</code> to redistribute leaked routes that are learnt using the ISIS protocol. |
|                         | <b>route-map</b>                                                     | Enter the name of the route-map to specify the filtering criteria for imported routes.                              |
| <b>Defaults</b>         | N/A                                                                  |                                                                                                                     |
| <b>Command Modes</b>    | CONFIGURATION                                                        |                                                                                                                     |
| <b>Command History</b>  | <b>Version</b>                                                       | <b>Description</b>                                                                                                  |
|                         | 9.7(0.0)                                                             | Introduced on the S4810, S4820T, S5000, S6000, S6000–ON, and Z9500.                                                 |

## interface management

Associates a management port with a management VRF.

|                 |                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>   | <code>interface management</code><br>To delete the association between a management port and a management VRF, use the <code>no interface management</code> command. |
| <b>Defaults</b> | None.                                                                                                                                                                |

**Command Modes** VRF MODE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON.           |
| 9.5(0.0)  | Introduced on the Z9500.              |
| 9.4.(0.0) | Introduced on the S-Series and Z9000. |

**Usage Information** Use this command to associate a management port with a management VRF. When you execute this command, the management ports corresponding to both the ACTIVE unit as well as the STANDBY unit are associated with the management VRF.

## maximum dynamic-routes

Specify the maximum number of dynamic (protocol) routes a VRF can have.

**Syntax** `maximum dynamic-routes limit {warn-threshold threshold-value | warning-only}`

To remove the limit on the maximum number of routes used, use the `no maximum dynamic-routes` command.

### Parameters

|                          |                                                                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>limit</b>             | Maximum number of routes allowed in a VRF. Valid range is from 1 to 16,000 (or maximum allowable for that platform if smaller value).                                                                                                                                                                             |
| <b>warning-threshold</b> | Warning threshold value is expressed as a percentage of the limit value. When the number of routes reaches the specified percentage of the limit, a warning message is generated. Valid range is 1 to 100. When warn-threshold is used, once the limit is reached, additional dynamic routes will not be allowed. |
| <b>warning-only</b>      | When the warning-only option is used, a syslog message will be thrown when maximum number of dynamic routes reaches the limit. Additional dynamic routes will still allowed.                                                                                                                                      |

**Defaults** No limit is set on the maximum number of dynamic routes for a VRF.

**Command Modes** CONFIGURATION-VRF

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON and Z9500. |
| 9.4(0.0) | Introduced on the S-Series.           |

**Usage Information** If the maximum route limit is not specified for a VRF, then it has unlimited space that extends to the maximum number of entries allowed for the system. This command is not applicable to the default and management VRFs.

## show ip vrf

Displays information corresponding to the VRFs that are configured in the system.

**Syntax** `show ip [vrf vrf-name]`

**Parameters** **vrf vrf-name** Enter the keyword vrf and then the name of the VRF to display information corresponding to that VRF..

**Command Modes** EXEC

EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                           |
|----------|---------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.           |
| 9.4(0.0) | Introduced on the S-Series and Z9000. |

**Example**

```
show ip vrf
VRF-Name                VRF-ID Interfaces
default                  0          Te 0/0-13,18-47,
                        Fo 0/48,52,56,60,
                        Ma 0/0,
                        Ma 1/0,
```

```

management    64     Te 0/15

```

```

FTOS#show ip vrf test1
VRF-Name          VRF-ID Interfaces
test1             1      Te 0/14,16-17

```

## show run vrf

Displays configuration information corresponding to all the VRFs in the system.

**Syntax** `show run vrf vrf-name`

**Parameters** `vrf vrf-name` Enter the keyword `vrf` and then the name of the VRF..

**Command Modes**

- EXEC
- EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                           |
|-----------|---------------------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON and Z9500. |
| 9.4.(0.0) | Introduced on the S-Series and Z9000. |

**Usage Information** Use this command to display information from the running-config corresponding to either a specific VRF or all the VRFs in the system.

**Example**

```

Dell#show run vrf test3
!
ip vrf test3
description "Banking Customer Chennai"

```

Related  
Commands

# Virtual Router Redundancy Protocol (VRRP)

Virtual router redundancy protocol (VRRP) is supported by the Dell Networking operating system on Dell Networking OS.

## IPv4 VRRP Commands

The following are IPv4 VRRP commands.

### advertise-interval

Set the time interval between VRRP advertisements.

**Syntax** `advertise-interval {seconds | centiseecs centiseecs }`  
To return to the default settings, use the `no advertise-interval` command.

**Parameters**

|                                        |                                                                                                                                                                                |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b>                         | Enter a number of seconds. The range is from 1 to 255. The default is <b>1 second</b> .                                                                                        |
| <b>centiseecs</b><br><b>centiseecs</b> | Enter the keyword <code>centiseecs</code> followed by the number of centiseecs in multiple of 25 centiseecs. The range is 25 to 4075 centiseecs in multiples of 25 centiseecs. |

**Defaults** 1 second or 100 centiseecs.

**Command Modes** INTERFACE-VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |

| Version  | Description                                                                 |
|----------|-----------------------------------------------------------------------------|
| 9.5(0.0) | Added support for centiseconds on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                                    |
| 9.0.2.0  | Introduced on the S6000.                                                    |
| 8.3.19.0 | Introduced on the S4820T.                                                   |
| 8.3.11.1 | Introduced on the Z9000.                                                    |
| 8.3.7.0  | Introduced on the S4810.                                                    |
| 7.6.1.0  | Introduced on the S-Series.                                                 |
| 7.5.1.0  | Introduced on the C-Series.                                                 |
| 6.2.1.1  | Introduced on the E-Series.                                                 |

**Usage Information** Dell Networking recommends keeping the default setting for this command. If you do change the time interval between VRRP advertisements on one router, change it on all routers.

## authentication-type

Enable authentication of VRRP data exchanges.

**Syntax** `authentication-type simple [encryption-type] password`  
 To delete an authentication type and password, use the `no authentication-type` command.

**Parameters**

|                        |                                                                                                                                                                                                                                                                                                                           |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>simple</b>          | Enter the keyword <code>simple</code> to specify simple authentication.                                                                                                                                                                                                                                                   |
| <b>encryption-type</b> | (OPTIONAL) Enter one of the following numbers: <ul style="list-style-type: none"> <li>• 0 (zero) specifies an un-encrypted authentication data follows.</li> <li>• 7 (seven) specifies a hidden authentication data follows.</li> <li>• <code>LINE</code> is the un-encrypted (cleartext) authentication data.</li> </ul> |
| <b>password</b>        | Enter a character string up to eight characters long as a password. If you do not enter an encryption-type, the password is stored as clear text.                                                                                                                                                                         |

**Defaults** Not configured.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** The given password is encrypted by the system and the `show config` displays an encrypted text string for any of the encrypted typed used.

## clear counters vrrp

Clear the counters maintained on VRRP operations.

### S4820T

**Syntax** `clear counters vrrp [vrrp-id] [ipv6] [vrf vrf-name]`

#### Parameters

|                     |                                                                                                                                                                    |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrrp-id</b>      | (OPTIONAL) Enter the number of the VRRP group ID. The range is from 1 to 255.                                                                                      |
| <b>ipv6</b>         | (OPTIONAL) Enter the keyword <code>ipv6</code> to clear counters from the IPv6 VRRP group.                                                                         |
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to clear counters that are maintained on the VRRP operations corresponding to that VRF. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version   | Description                 |
|-----------|-----------------------------|
| 9.7(0.0)  | Introduced on the S6000-ON. |
| 9.4.(0.0) | Added support for VRF.      |
| 9.2(1.0)  | Introduced on the Z9500.    |
| 9.0.2.0   | Introduced on the S6000.    |

| Version  | Description                 |
|----------|-----------------------------|
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

### Example

```
Dell#clear counters vrrp vrf jay
Clear "show vrrp" counters of all vrrp groups on all
interfaces in VRF jay [confirm] yes
```

## debug vrrp

Allows you to enable debugging of VRRP.

### Syntax

```
debug vrrp interface [vrrp-id] {all | bfd | database |
interface | ipv6 | packets | state | timer}
```

To disable debugging, use the `no debug vrrp interface [vrrp-id] {all | bfd | database | interface | ipv6 | packets | state | timer}` command.

### Parameters

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b> | Enter the following keywords and slot/port or number information <ul style="list-style-type: none"> <li>For Port Channel interface types, enter the keywords <code>port-channel</code> then the number. The range is from 1 to 128.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then the VLAN ID. The VLAN ID range is from 1 to 4094.</li> </ul> |
| <b><i>vrrp-id</i></b>   | (OPTIONAL) Enter a number from 1 to 255 as the VRRP group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>all</b>              | Enter the keyword <code>all</code> to enable debugging of all VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>bfd</b>              | Enter the keyword <code>bfd</code> to enable debugging of VRRP BFD interactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>database</b>         | Enter the keyword <code>database</code> to enable debugging of configuration changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                  |                                                                                           |
|------------------|-------------------------------------------------------------------------------------------|
| <b>interface</b> | Enter the keyword <code>interface</code> to enable debugging of interface state changes.. |
| <b>ipv6</b>      | Enter the keyword <code>ipv6</code> to enable debugging for IPv6.                         |
| <b>packets</b>   | Enter the keyword <code>packets</code> to enable debugging of VRRP control packets.       |
| <b>state</b>     | Enter the keyword <code>state</code> to enable debugging of VRRP state changes.           |
| <b>timer</b>     | Enter the keyword <code>timer</code> to enable debugging of the VRRP timer.               |

**Command Modes**

EXEC Privilege

**Command History**

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| <b>Version</b>  | <b>Description</b>          |
|-----------------|-----------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON. |
| <b>9.0.2.0</b>  | Introduced on the S6000.    |
| <b>8.3.19.0</b> | Introduced on the S4820T.   |
| <b>8.3.11.1</b> | Introduced on the Z9000.    |
| <b>8.3.7.0</b>  | Introduced on the S4810.    |
| <b>7.5.1.0</b>  | Introduced on the C-Series. |
| <b>6.2.1.1</b>  | Introduced on the E-Series. |

**Usage Information**

If no options are specified, debug is active on all interfaces and all VRRP groups.

**description**

Configure a short text string describing the VRRP group.

**Syntax** `description text`  
 To delete a VRRP group description, use the `no description` command.

**Parameters**

**text** Enter a text string up to 80 characters long.

**Defaults** Not enabled.

**Command Modes** VRRP

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## disable

Disable a VRRP group.

### Syntax

```
disable
```

To re-enable a disabled VRRP group, use the `no disable` command.

### Command Modes

VRRP

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information** To enable VRRP traffic, assign an IP address to the VRRP group using the `virtual-address` command and enter `no disable`.

**Related Commands** [virtual-address](#) — specifies the IP address of the virtual router.

## hold-time

Specify a delay (in seconds) before a switch becomes the MASTER virtual router. By delaying the initialization of the VRRP MASTER, the new switch can stabilize its routing tables.

**Syntax** `hold-time {seconds | centiseconds centiseconds}`  
 To return to the default value, use the `no hold-time` command.

**Parameters**

|                                  |                                                                                                                                                                                  |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>seconds</b>                   | Enter the number of seconds. The range is from 0 to 65535. The default is <b>zero (0) seconds</b> .                                                                              |
| <b>centiseconds centiseconds</b> | Enter the keyword <code>centiseconds</code> then the number of <code>centiseconds</code> in units of 25 centiseconds . The range is from 0 to 65525 in units of 25 centiseconds. |

**Defaults** **zero (0) seconds or or (0) centiseconds**

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                 |
|----------|-----------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                 |
| 9.5(0.0) | Added support for centiseconds on the Z9000, S6000, S4820T, S4810, and MXL. |
| 9.2(1.0) | Introduced on the Z9500.                                                    |
| 9.0.2.0  | Introduced on the S6000.                                                    |
| 8.3.19.0 | Introduced on the S4820T.                                                   |
| 8.3.11.1 | Introduced on the Z9000.                                                    |
| 8.3.7.0  | Introduced on the S4810.                                                    |
| 7.6.1.0  | Introduced on the S-Series.                                                 |
| 7.5.1.0  | Introduced on the C-Series.                                                 |
| 6.2.1.1  | Introduced on the E-Series.                                                 |

|                          |                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | If a switch is a MASTER and you change the hold timer, disable and re-enable VRRP for the new hold timer value to take effect. |
| <b>Related Commands</b>  | <a href="#">disable</a> — disables a VRRP group.                                                                               |

## preempt

To preempt or become the MASTER router, permit a BACKUP router with a higher priority value.

|                        |                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>preempt</code><br>To prohibit preemption, use the <code>no preempt</code> command.                                                                                                                                                                  |
| <b>Defaults</b>        | Enabled (that is, a BACKUP router can preempt the MASTER router).                                                                                                                                                                                         |
| <b>Command Modes</b>   | VRRP                                                                                                                                                                                                                                                      |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .<br><br>The following is a list of the Dell Networking OS version history for this command. |

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## priority

Specify a VRRP priority value for the VRRP group. The VRRP protocol uses this value during the MASTER election process.

|                   |                                                                                                                                                 |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>     | <code>priority priority</code><br>To return to the default value, use the <code>no priority</code> command.                                     |
| <b>Parameters</b> | <b><i>priority</i></b> Enter a number as the priority. Enter 255 only if the router's virtual address is the same as the interface's primary IP |

address (that is, the router is the OWNER). The range is from 1 to 255. The default is **100**.

**Defaults** **100**

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.16.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information**

To guarantee that a VRRP group becomes MASTER, configure the VRRP group's virtual address with same IP address as the interface's primary IP address and change the priority of the VRRP group to 255.

If you set the `priority` command to 255 and the `virtual-address` is not equal to the interface's primary IP address, an error message appears.

## show config

View the non-default VRRP configuration.

**Syntax** `show config [verbose]`

**Parameters**

|                |                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>verbose</b> | (OPTIONAL) Enter the keyword <code>verbose</code> to view all VRRP group configuration information, including defaults. |
|----------------|-------------------------------------------------------------------------------------------------------------------------|

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

#### Example

```
Dell(conf-if-vrid-4)#show config
 vrrp-group 4
  virtual-address 119.192.182.124
!
```

## show vrrp

View the VRRP groups that are active. If no VRRP groups are active, the Dell Networking OS returns No Active VRRP group.

### S4820T

#### Syntax

```
show vrrp [vrrp-id] [vrf vrf-name] [interface] [brief][ipv6]
```

#### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrrp-id</b>      | (OPTIONAL) Enter the Virtual Router Identifier for the VRRP group to view only that group. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>vrf vrf-name</b> | (OPTIONAL) Enter the keyword <code>vrf</code> and then the name of the VRF to view active VRRP groups corresponding to that VRF.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>interface</b>    | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For Port Channel interface types, enter the keywords <code>port-channel</code> then the number. The range is from 1 to 128.</li> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then the VLAN ID. The VLAN ID range is from 1 to 4094.</li> </ul> |
| <b>brief</b>        | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information on the VRRP groups.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ipv6</b>         | (OPTIONAL) Enter the keyword <code>ipv6</code> to view only VRRP IPv6 groups.                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Command Modes

- EXEC Privilege

## Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.4(0.0) | Added support for VRF.      |
| 9.2(1.0) | Introduced on the Z9500.    |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

## Usage Information

The following describes the `show vrrp brief` command shown in the following example.

| Item      | Description                                                                                                                                                                                                                                  |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Lists the interface type, slot and port on which the VRRP group is configured.                                                                                                                                                               |
| Grp       | Displays the VRRP group ID.                                                                                                                                                                                                                  |
| Pri       | Displays the priority value assigned to the interface. If the <code>track</code> command is configured to track that interface and the interface is disabled, the cost is subtracted from the priority value assigned to the interface.      |
| Pre       | States whether preempt is enabled on the interface. <ul style="list-style-type: none"><li>• Y = Preempt is enabled.</li><li>• N = Preempt is not enabled.</li></ul>                                                                          |
| State     | Displays the operational state of the interface by using one of the following: <ul style="list-style-type: none"><li>• NA/IF (the interface is not available).</li><li>• MASTER (the interface associated with the MASTER router).</li></ul> |

| Item                   | Description                                                                                                   |
|------------------------|---------------------------------------------------------------------------------------------------------------|
|                        | <ul style="list-style-type: none"> <li>• BACKUP (the interface associated with the BACKUP router).</li> </ul> |
| <b>Master addr</b>     | Displays the IP address of the MASTER router.                                                                 |
| <b>Virtual addr(s)</b> | Displays the virtual IP addresses of the VRRP routers associated with the interface.                          |

**Example (Brief)**

```
Dell>Interface Grp Pri Pre State Master addr Virtual addr(s)
Description-----
-----
Te 1/37 1 100 Y Master 200.200.200.200 200.200.200.201
Te 1/37 2 100 Y Master 200.200.200.200 200.200.200.202

```

**Usage Information**

The following describes the `show vrrp` command shown in the following example.

| Item                             | Description                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TenGigabitEthernet 1/3...</b> | Displays the Interface, the VRRP group ID, and the network address. If the interface is not sending VRRP packets, 0.0.0.0 appears as the network address.                                                                                                                                                                                            |
| <b>State: master...</b>          | <p>Displays the interface's state:</p> <ul style="list-style-type: none"> <li>• Na/If (not available)</li> <li>• master (MASTER virtual router)</li> <li>• backup (BACKUP virtual router)</li> </ul> <p>the interface's priority and the IP address of the MASTER.</p>                                                                               |
| <b>Hold Down:...</b>             | <p>This line displays additional VRRP configuration information:</p> <ul style="list-style-type: none"> <li>• Hold Down displays the hold down timer interval in seconds.</li> <li>• Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.</li> <li>• AdvInt displays the Advertise Interval in seconds.</li> </ul> |
| <b>Adv rcvd:...</b>              | <p>This line displays counters for the following:</p> <ul style="list-style-type: none"> <li>• Adv rcvd displays the number of VRRP advertisements received on the interface.</li> <li>• Adv sent displays the number of VRRP advertisements sent on the interface.</li> </ul>                                                                       |

| Item                       | Description                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | <ul style="list-style-type: none"> <li>• Gratuitous ARP sent displays the number of gratuitous ARPs sent.</li> </ul>                                                                                                                                                                                                                           |
| <b>Virtual MAC address</b> | Displays the virtual MAC address of the VRRP group.                                                                                                                                                                                                                                                                                            |
| <b>Virtual IP address</b>  | Displays the virtual IP address of the VRRP router to which the interface is connected.                                                                                                                                                                                                                                                        |
| <b>Authentication:...</b>  | States whether authentication is configured for the VRRP group. If it is, the authentication type and the password are listed.                                                                                                                                                                                                                 |
| <b>Tracking states..</b>   | <p>This line is displayed if the <code>track</code> command is configured on an interface. Below this line, the following information on the tracked interface is displayed:</p> <ul style="list-style-type: none"> <li>• Dn or Up states whether the interface is down or up.</li> <li>• the interface type slot/port information.</li> </ul> |

#### Example

```
Dell>show vrrp
-----

Dell#

```

## track

Monitor an interface and lower the priority value of the VRRP group on that interface if it is disabled.

**Syntax** `track interface [priority-cost cost]`

To disable monitoring, use the `no track interface` command.

### Parameters

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>interface</i></b>     | (OPTIONAL) Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a Loopback interface, enter the keyword <code>loopback</code> then a number from 0 to 16383.</li> <li>For Port Channel interface types, enter the keywords <code>port-channel</code> then a number.</li> <li>For a 40-Gigabit Ethernet interface, enter the keyword <code>fortyGigE</code> then the slot/port information.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> followed by the VLAN ID. The VLAN ID range is from 1 to 4094.</li> </ul> |
| <b><i>priority-cost</i></b> | (OPTIONAL) Enter a number as the amount to be subtracted from the priority value. The range is 1 to 254. The default is <b>10</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Defaults** priority cost = **10**

**Command Modes** VRRP

### Command History

| Version  | Description                            |
|----------|----------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.            |
| 9.0.2.0  | Introduced on the S6000.               |
| 7.6.1.0  | Introduced on the S-Series (S50 only). |
| 7.5.1.0  | Introduced on the C-Series.            |
| 6.2.1.1  | Introduced on the E-Series.            |

**Usage Information** If the interface is disabled, the cost value is subtracted from the priority value and forces a new MASTER election if the priority value is lower than the priority value in the BACKUP virtual routers.

## version

Set VRRP protocol version for IPv4 group.

**Syntax** `version {2 | 3 | both}`  
To return to the default setting, use the `no version` command.

**Parameters**

|             |                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------|
| <b>2</b>    | Enter the 2 parameter to specify VRRP version 2 as defined by RFC 3768, <i>Virtual Router Redundancy Protocol</i> . |
| <b>3</b>    | Enter the 2 parameter to specify VRRP version 3 as defined in RFC 5798, <i>Virtual Router Redundancy</i> .          |
| <b>both</b> | Enter the <code>both</code> keyword for in-service migration from VRRP version 2 to VRRP version 3.                 |

**Defaults** 2

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                             |
|----------|---------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                             |
| 9.5(0.0) | Introduced on the Z9000, S6000, S4820T, S4810, and MXL. |

**Usage Information** You can use the `version both` command to migrate from VRRPv2 to VRRPv3. When you set the VRRP protocol version to `both`, the switch sends only VRRPv3 advertisements but can receive either VRRPv2 or VRRPv3 packets. To migrate an IPv4 VRRP group from VRRPv2 to VRRPv3:

1. Set the switches with the lowest priority to "both".
2. Set the switch with the highest priority to version to 3.
3. Set all the switches from both to version 3.

**NOTE:** Do not run VRRP version 2 and version 3 in the same group for an extended period of time.

**Example**

```
Dell(conf-if-te-1/1-vrid-100)#version ?
2                               VRRPv2
3                               VRRPv3
both                            Interoperable, send VRRPv3 receive
both
```

```
Dell(conf-if-te-1/1-vrid-100)#version 3
```

## virtual-address

Configure up to 12 IP addresses of virtual routers in the VRRP group. To start sending VRRP packets, set at least one virtual address for the VRRP group.

**Syntax** `virtual-address ip-address1 [... ip-address12]`  
 To delete one or more virtual IP addresses, use the `no virtual-address ip-address1 [... ip-address12]` command.

**Parameters**

|                                |                                                                                                                                                                                                                           |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ip-address1</i></b>      | Enter an IP address of the virtual router in dotted decimal format. The IP address must be on the same subnet as the interface's primary IP address.                                                                      |
| <b><i>... ip-address12</i></b> | (OPTIONAL) Enter up to 11 additional IP addresses of virtual routers in dotted decimal format. Separate the IP addresses with a space. The IP addresses must be on the same subnet as the interface's primary IP address. |

**Defaults** Not configured.

**Command Modes** VRRP

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version         | Description                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                                                 |
| <b>9.0.2.0</b>  | Introduced on the S6000.                                                                    |
| <b>8.3.19.0</b> | Introduced on the S4820T.                                                                   |
| <b>8.3.11.1</b> | Introduced on the Z9000.                                                                    |
| <b>8.3.7.0</b>  | Introduced on the S4810.                                                                    |
| <b>7.6.1.0</b>  | Introduced on the S-Series.                                                                 |
| <b>7.5.1.0</b>  | Introduced on the C-Series.                                                                 |
| <b>7.4.1.0</b>  | Introduced support for telnetting to the VRRP group IP address assigned using this command. |

| Version | Description                 |
|---------|-----------------------------|
| 6.2.1.1 | Introduced on the E-Series. |

**Usage Information**

The VRRP group only becomes active and sends VRRP packets when a virtual IP address is configured. When you delete the virtual address, the VRRP group stops sending VRRP packets.

A system message appears after you enter or delete the `virtual-address` command.

To guarantee that a VRRP group becomes MASTER, configure the VRRP group's virtual address with the same IP address as the interface's primary IP address and change the priority of the VRRP group to 255.

You can ping the virtual addresses configured in all VRRP groups.

### vrrp delay minimum

Set the delay time for VRRP initialization after an interface comes up.

**Syntax** `vrrp delay minimum seconds`

**Parameters** `seconds` Enter the number of seconds for the delay for VRRP initialization after an interface becomes operational. The range is from 0 to 900 (0 indicates no delay).

**Defaults** 0

**Command Modes** INTERFACE

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.8.0  | Introduced on the S4810.    |

**Usage Information**

This command applies to a single interface. When used with the `vrrp delay reload` CLI, the later timer rules the VRRP enabling. For example, if `vrrp delay reload` is 600 and the `vrrp delay minimum` is 300:

- When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.
- When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.

**Related Command**      [vrrp delay reload](#) — sets the delay time for VRRP initialization after a system reboot.

## vrrp delay reload

Set the delay time for VRRP initialization after a system reboot.

|                        |                                                                                                                                                                |                                                                                               |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>vrrp delay reload seconds</code>                                                                                                                         |                                                                                               |
| <b>Parameters</b>      | <b>seconds</b>                                                                                                                                                 | Enter the number of seconds for the delay. The range is from 0 to 900 (0 indicates no delay). |
| <b>Defaults</b>        | 0                                                                                                                                                              |                                                                                               |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                      |                                                                                               |
| <b>Command History</b> | This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> . |                                                                                               |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 9.0.0.0  | Introduced on the Z9000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.8.0  | Introduced on the S4810.    |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Usage Information</b> | <p>This command applies to all the VRRP configured interfaces on a system. When used with the <code>vrrp delay minimum</code> CLI, the later timer rules the VRRP enabling. For example, if <code>vrrp delay reload</code> is 600 and the <code>vrrp delay minimum</code> is 300:</p> <ul style="list-style-type: none"> <li>• When the system reloads, VRRP waits 600 seconds (10 minutes) to bring up VRRP on all interfaces that are up and configured for VRRP.</li> <li>• When an interface comes up, whether as part of a system reload or an interface reload, the system waits 300 seconds (5 minutes) to bring up VRRP on that interface.</li> </ul> |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Save the configuration and reload the system for the delay timers to take effect.

**Related Command**      [vrrp delay minimum](#) — sets the delay time for VRRP initialization after a line card reboot.

## vrrp-group

Assign a VRRP ID to an interface. You can configure up to 12 VRRP groups per interface.

**Syntax**                      `vrrp-group vrrp-id`

**Parameters**                      **vrrp-id**                      Enter a number as the group ID. The range is from 1 to 255.

**Defaults**                      Not configured.

**Command Modes**                      INTERFACE

**Command History**                      This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 9.0.2.0  | Introduced on the S6000.    |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.11.1 | Introduced on the Z9000.    |
| 8.3.7.0  | Introduced on the S4810.    |
| 7.6.1.0  | Introduced on the S-Series. |
| 7.5.1.0  | Introduced on the C-Series. |
| 6.2.1.1  | Introduced on the E-Series. |

**Usage Information**                      The VRRP group only becomes active and sends VRRP packets when a virtual IP address is configured. When you delete the virtual address, the VRRP group stops sending VRRP packets.

**Related Command**                      [virtual-address](#) — assigns up to 12 virtual IP addresses per VRRP group.

## IPv6 VRRP Commands

The following are IPv6 VRRP commands.

- [clear counters vrrp ipv6](#)

- [debug vrrp ipv6](#)
- [show vrrp ipv6](#)
- [vrrp-ipv6-group](#)

The following commands apply to IPv4 and IPv6:

- [advertise-interval](#)
- [description](#)
- [disable](#)
- [hold-time](#)
- [preempt](#)
- [priority](#)
- [show config](#)
- [virtual-address](#)

## clear counters vrrp ipv6

Clear the counters recorded for IPv6 VRRP groups.

**Syntax** `clear counters vrrp ipv6 [vrid | vrf vrf-name]`

**Parameters**

|                            |                                                                                                                                         |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>vrid</i></b>         | (OPTIONAL) Enter the number of an IPv6 VRRP group. The range is from 1 to 255.                                                          |
| <b>vrf <i>vrf-name</i></b> | (OPTIONAL) Enter the name of a VRF instance (32 characters maximum) to clear the counters of all IPv6 VRRP groups in the specified VRF. |

**Command Modes** EXEC Privilege

**Command History** This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------------------|
| 9.7(0.0) | Introduced on the S6000-ON.                                                                                                   |
| 8.3.19.0 | Introduced on the S4820T.                                                                                                     |
| 8.3.10.0 | Introduced on the S4810.                                                                                                      |
| 8.4.1.0  | Introduced on E-Series ExaScale, C-Series, and S-Series. Support was added for IPv6 VRRP groups in non-default VRF instances. |
| 8.3.2.0  | Introduced on the E-Series TeraScale.                                                                                         |

## debug vrrp ipv6

Allows you to enable debugging of VRRP.

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |             |                                                               |            |                                                                            |            |                                                                                      |                 |                                                                                                                               |                |                                                                                     |              |                                                                                 |              |                                                                             |

For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |             |                                                               |            |                                                                            |            |                                                                                      |                 |                                                                                                                               |                |                                                                                     |              |                                                                                 |              |                                                                             |

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                 |
|----------|-----------------------------|
| 9.7(0.0) | Introduced on the S6000-ON. |
| 8.3.19.0 | Introduced on the S4820T.   |
| 8.3.10.0 | Introduced on the S4810.    |

| Version | Description                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------|
| 8.4.1.0 | Introduced on E-Series ExaScale, C-Series, and S-Series. Support was added for IPv6 VRRP groups in non-default VRF instances. |
| 8.3.2.0 | Introduced on the E-Series TeraScale.                                                                                         |

**Usage Information** If no options are specified, debug is active on all interfaces and all VRRP groups.

## show vrrp ipv6

View the IPv6 VRRP groups that are active. If no VRRP groups are active, the Dell Networking OS returns `No Active VRRP group.`

**Syntax** `show vrrp ipv6 [vrid] [interface] [brief] [vrf vrf-name]`

### Parameters

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>vrid</b>         | (OPTIONAL) Enter the virtual router identifier for the VRRP group to view only that group. The range is from 1 to 255.                                                                                                                                                                                                                                                                                                                         |
| <b>interface</b>    | Enter the following keywords and slot/port or number information: <ul style="list-style-type: none"> <li>For a 10-Gigabit Ethernet interface, enter the keyword <code>TenGigabitEthernet</code> then the slot/port information.</li> <li>For a port channel interface, enter the keywords <code>port-channel</code> then a number.</li> <li>For a VLAN interface, enter the keyword <code>vlan</code> then a number from 1 to 4094.</li> </ul> |
| <b>brief</b>        | (OPTIONAL) Enter the keyword <code>brief</code> to view a table of information on the VRRP groups.                                                                                                                                                                                                                                                                                                                                             |
| <b>vrf vrf-name</b> | Enter the keyword <code>vrf</code> followed by the name of the VRF to view IPv6 VRRP groups corresponding to that VRF.                                                                                                                                                                                                                                                                                                                         |

### Command Modes

- EXEC Privilege

### Command History

This guide is platform-specific. For command information about other platforms, refer to the relevant *Dell Networking OS Command Line Reference Guide*.

The following is a list of the Dell Networking OS version history for this command.

| Version  | Description                                        |
|----------|----------------------------------------------------|
| 9.7(0.0) | Added support for VRF. Introduced on the S6000-ON. |
| 9.2(1.0) | Introduced on the Z9500.                           |

| Version  | Description                           |
|----------|---------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.10.0 | Introduced on the S4810.              |
| 8.3.2.0  | Introduced on the E-Series TeraScale. |

**Usage Information**

The following describes the `show vrrp ipv6` command shown in the following example.

| Line Beginning with | Description                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GigabitEthernet...  | Displays the Interface, the VRRP group ID, and the network address. If the interface is no sending VRRP packets, 0.0.0.0 appears as the network address.                                                                                                                                                                                                           |
| VRF                 | VRF instance to which the interface (on which the VRRP group is configured) belongs.                                                                                                                                                                                                                                                                               |
| State: master...    | Displays the interface's state: <ul style="list-style-type: none"> <li>• Na/If (not available).</li> <li>• master (MASTER virtual router).</li> <li>• backup (BACKUP virtual router).</li> </ul> the interface's priority and the IP address of the MASTER.                                                                                                        |
| Hold Down:...       | This line displays additional VRRP configuration information: <ul style="list-style-type: none"> <li>• Hold Down displays the hold down timer interval in seconds.</li> <li>• Preempt displays TRUE if preempt is configured and FALSE if preempt is not configured.</li> <li>• AdvInt displays the Advertise Interval in seconds.</li> </ul>                      |
| Adv rcvd:...        | This line displays counters for the following: <ul style="list-style-type: none"> <li>• Adv rcvd displays the number of VRRP advertisements received on the interface.</li> <li>• Adv sent displays the number of VRRP advertisements sent on the interface.</li> <li>• Bad pkts rcvd displays the number of invalid packets received on the interface.</li> </ul> |
| Virtual MAC address | Displays the virtual MAC address of the VRRP group.                                                                                                                                                                                                                                                                                                                |
| Virtual IP address  | Displays the virtual IP address of the VRRP router to which the interface is connected.                                                                                                                                                                                                                                                                            |
| Tracking states...  | Displays information on the tracked interfaces or objects configured for a VRRP group ( <code>track</code> command), including:                                                                                                                                                                                                                                    |

| Line Beginning with | Description                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | <ul style="list-style-type: none"> <li>UP or DOWN state of the tracked interface or object (Up or Dn).</li> <li>Interface type and slot/port or object number, description, and time since the last change in the state of the tracked object.</li> <li>Cost to be subtracted from the VRRP group priority if the state of the tracked interface/object goes DOWN.</li> </ul> |

**Example**

```
Dell#show vrrp ipv6
-----
TenGigabitEthernet 5/6, IPv6 VRID: 255, Version: 3, Net:
fe80::201:e8ff:fe7a:6bb9
VRF: 0 default-vrf
State: Master, Priority: 101, Master: fe80::201:e8ff:fe7a:6bb9
(local)
Hold Down: 0 centisec, Preempt: TRUE, AdvInt: 100 centisec
Accept Mode: FALSE, Master AdvInt: 100 centisec
Adv rcvd: 0, Bad pkts rcvd: 0, Adv sent: 64
Virtual MAC address:
  00:00:5e:00:02:ff
Virtual IP address:
  1::255 fe80::255
```

**vrrp-ipv6-group**

Assign an interface to a VRRP group.

|                        |                                                                                                                                                                                                                                                                 |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>          | <code>vrrp-ipv6-group vrid</code>                                                                                                                                                                                                                               |
| <b>Parameters</b>      | <p><b>vrid</b> Enter the virtual-router ID number of the VRRP group. The VRID range is from 1 to 255.</p>                                                                                                                                                       |
| <b>Defaults</b>        | Not configured.                                                                                                                                                                                                                                                 |
| <b>Command Modes</b>   | INTERFACE                                                                                                                                                                                                                                                       |
| <b>Command History</b> | <p>This guide is platform-specific. For command information about other platforms, refer to the relevant <i>Dell Networking OS Command Line Reference Guide</i>.</p> <p>The following is a list of the Dell Networking OS version history for this command.</p> |

| Version         | Description                                                                                              |
|-----------------|----------------------------------------------------------------------------------------------------------|
| <b>9.7(0.0)</b> | Introduced on the S6000-ON.                                                                              |
| <b>8.4.2.1</b>  | The range of valid VRID values on the E-Series when VRF microcode is loaded in CAM changed from 1 to 15. |
| <b>8.4.1.0</b>  | Introduced on the E-Series ExaScale, C-Series, and S-Series.                                             |

| Version  | Description                           |
|----------|---------------------------------------|
| 8.3.19.0 | Introduced on the S4820T.             |
| 8.3.7.0  | Introduced on the S4810.              |
| 8.3.2.0  | Introduced on the E-Series TeraScale. |

### Usage Information

The VRRP group only becomes active and sends VRRP packets when a link-local virtual IP address is configured. When you delete the virtual address, the VRRP group stops sending VRRP packets.

- When VRF microcode is not loaded in CAM, the VRID for a VRRP group is the same as the VRID number configured with the `vrrp-group` or `vrrp-ipv6-group` command.
- When VRF microcode is loaded in CAM, the VRID for a VRRP group is equal to 16 times the `vrrp-group` or `vrrp-ipv6-group vrid` number plus the `ip vrf vrf-id` number. For example, if VRF microcode is loaded and VRRP group 10 is configured in VRF 2, the VRID used for the VRRP group is  $(16 \times 10) + 2$ , or 162. This VRID value is used in the lowest byte of the virtual MAC address of the VRRP group and is also used for VRF routing.

**NOTE:** Configure the same VRID on neighboring routers (Dell Networking or non-Dell Networking) in the same VRRP group in order for all routers to interoperate.

### Related Commands

[virtual-address](#) — assigns up to 12 virtual IP addresses per VRRP group.
